Readers of WHITAKER will by now be fairly familiar with our name and goods as our announcement appears for the 34th year on this page. It must be known, therefore, that our operations extend to all parts of the globe. We export to the tropics—our thinnest Cashmeres. To semi-tropical countries—our superfine Flannels and Flannel Tweeds. To temperate climates — Worsteds, Serges, Saxonies, and the finer Tweeds. To cold climates, and winter wear generally — our heavy Tweeds, and Cheviots; and for overcoats—Fleeces and Friezes. For sport and travel—Scotch and Irish Homespuns. Of all these woollens (some of the best examples of British manufacture) we keep a very extensive stock. Prices are much reduced, though not yet stabilised, owing to the international situation, which at present holds little prospect of amelioration. Visitors from Overseas are specially urged to visit the warehouse when in London, both traders and private persons; the proprietor would heartily welcome any of his old correspondents and be glad to render any assistance in his power. His has always been a personal and unique business, and he confines himself to the fostering of his own country's industries, unlike the generality of traders, who under our present fiscal system of Free imports (shortly, I hope, to be abandoned), have been for long encouraging our foreign competitors in this and other spheres, to the detriment of our own workpeople and their employers.—W. B.

HOMESPUNS—Irish and Scotch, peasant-made from all districts; for country wear, sport, and travelling.
SCOTCH CHEVIOTS; for warm, rough suits, and wraps.
IRISH FRIEZES; for heavy travelling and motoring ulsters.
FLEECES; for warm, soft, woolly overcoats, and capes.
HOMESPUNS; natural cream, brown, grey; and dyed colours.
INDIAN, Homespuns; from Cashmere, Thibet, &c.
IRISH TWEEDS; for hard useful wear; winter and summer.
TWEEDS; for ordinary town wear; various weights.
WORSTEDS; for business and professional wear. Dress suitings.
SERGES; navy and black; rough and smooth; all seasons.
CASHMERES; for tropical and semi-tropical wear.
TROUSERINGS; winter and summer weights.
FLANNEL TWEEDS; for light summer and semi-tropical wear.
COSTUME TWEEDS; for ladies' country and town wear.
OVERCOATINGS; light, medium, and heavy.
TRAVELLING RUGS—Irish and Scotch. 17/6 upwards.
SHETLAND hand-knit jumpers, jerseys, jackets, shawls, socks, &c.
SOCKS AND STOCKINGS; hand-knitted; Irish and Scotch.
ORIENTAL SILKS; for thinnest tropical suitings.
SHIRTINGS; for country and colonial wear; also shirts.

Pattern applications must be definite and descriptive of requirements, otherwise delay will result. They can only be sent to the provinces and abroad. TERMS:—Cash with order.

A visit to the warehouse is recommended whenever possible in order to view the extent of the stock, handle the goods, judge of their merit, and make a judicious selection.

SHIPPERS, the TRADE, and PUBLIC supplied at prices corresponding to extent of purchase. None but *bona fide* correspondence can be attended to.

PREFACE TO THE LVITH ANNUAL VOLUME.

(1924.)

WHEN the first sheets of the 1924 "WHITAKER" were sent to press there were no indications of an approaching Appeal to the Country, and by the time the date of the General Election was made known a great part of the book had been printed.

A considerable interval must of necessity elapse between the printing of the last sheet and the date of issue, as the books not only require to be bound but distributed equitably throughout the bookselling trade, in order that simultaneous publication may be effected. If, therefore, the binding of the volume had been postponed until the results of the Election could be incorporated, the book could not have been in the hands of the public until after Christmas or the New Year.

The difficulty has been overcome by providing a "General Election Supplement," which will be available for distribution with the book, or as soon as possible afterwards. Purchasers of the 1924 "WHITAKER" are entitled to a copy of this Supplement.

The general contents of the present volume have been subjected to a slight rearrangement, and space has been found for many additional statistics dealing with Trade and Finance. The recommendations of the Imperial and Economic Conferences are recorded, and the Prime Minister of New Zealand has contributed a special article on the opportunities afforded to prospective settlers in that Dominion. Imperial Preference, British and American Trade, and other current topics will be found under Questions of the Day, and the Produce and Exchange of Wheat and other Cereals are shown in statistical tables, while the articles on India and the British Dominions have received special care in view of the British Empire Exhibition to be held in 1924. The additions made have been so numerous that several pages have been added to the Index.

The Editor wishes to express once again his indebtedness to subscribers in all quarters of the globe for the suggestions they have made. A New Zealander, justly proud of his former home in the Stewartry, wrote from Nauru Island to request that the Scottish Burghs should be placed in alphabetical order; a Professor in Reykjavik asked for further statistics concerning the Death Duties in Great Britain; a Spaniard in the Argentine, with true Castilian courtesy and in idiomatic English, suggested the cross-referencing of figures showing the trade of one Country with another. These are typical of the many useful suggestions sent in, and it can almost be said that such correspondents edit "WHITAKER"; it can certainly be said that without their aid the Editor's task would be one of far greater difficulty. The co-operation so obligingly rendered is very highly appreciated, and it will always be the Editor's aim to foster and maintain the friendly interest of his subscribers.

Past, present and future correspondents are earnestly requested to note the first day of October as the latest date for suggestions, if they are to receive full consideration, especially when statistics not hitherto given are called for by the correspondent.

Humber

CARS — MOTOR CYCLES — CYCLES

¶ Perfect in every detail, whether of construction or performance, the latest Humber Models more than maintain a reputation long since established, and offer an attractiveness rarely found in other cars of approximately the same cost. Alike in open Models and in the saloons, comfort and elegance are combined with exceptional road performance, while the detail finish is everywhere of the very best. There is a model for every motoring requirement :—

8 h.p. LIGHT CAR (Chummy body)	£250
8 h.p. LIGHT CAR (2-seater with dickey seat) ...	£250
11.4 h.p. 2-SEATER with double dickey seat	£460

¶ The Humber 2¾ H.-P. Single Cylinder Motor Cycle is a wonderful model which has achieved phenomenal success in many strenuous tests. It is simple to control even in the hands of the novice, for there are no intricacies—every part is accessible, simple and strong. An absolutely reliable machine at a moderate price.

¶ The Humber range of cycles represent the accumulated experience of over half-a-century in cycle construction. Everyone of the models listed for Ladies, Gentlemen, and Juveniles is so skilfully designed and so perfect in every detail of manufacture that lasting satisfaction is assured.

Illustrated Catalogues of Cars, Motor Cycles or Cycles will be sent free on request.

STANFORD'S LIBRARY CHART OF THE WORLD.

REVISED EDITION.

Showing Land and Sea Communications.

On Mercator's projection. A clear, readable map, beautifully printed, and indispensable to the proper study of the general and commercial geography of the World. The latitude embraced on this chart includes the whole of the known land area on the North and extends to the Magnetic Pole on the South. The British Isles lie near the centre, and both the Eastern and Western Routes to the Antipodes are included. This chart has been prepared for general use, and shows all the principal ports and harbours of the World. Four sheets: 78 × 54 inches. Prices: Coloured sheets, **21s.** Mounted to fold in Case, **45s.** Mounted on Rollers and Varnished, **45s.** Mounted on Spring Roller, **120s.**

Equatorial scale of 360 nautical miles to an inch.

For Durability we strongly recommend intending purchasers to have the maps mounted, in either of the above ways.

Full list of maps sent gratis on request.

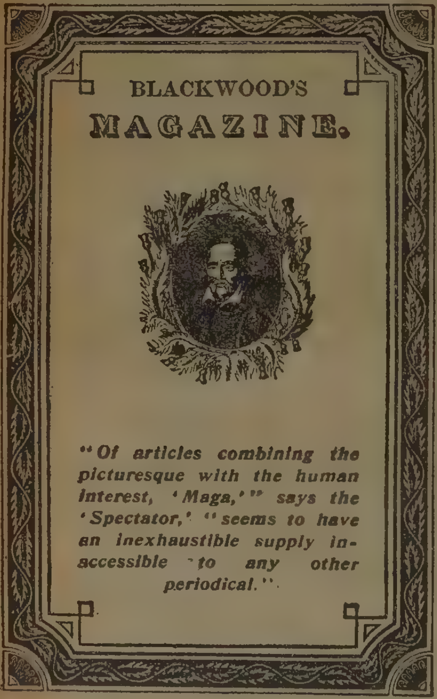
THE BEST INVESTMENT

No one who desires to be in touch with the best literature of the day can afford to omit BLACKWOOD'S MAGAZINE from his list of what MUST BE READ.



BLACKWOOD'S
MAGAZINE.

"Of articles combining the picturesque with the human interest, 'Maga,'" says the 'Spectator,' "seems to have an inexhaustible supply inaccessible to any other periodical."

For over 100 years MAGA has been the best British Magazine, and its fame, vitality, and circulation have never reached a higher point than at the present time.

AN AUSTRALIAN INVESTMENT

YESTERDAY, Canberra, the new Capital City of the Continent of Australia, was a beautiful stretch of Bushland enjoying a most perfect climate, awaiting its destiny.

TO-DAY, thousands of workmen are rushing on the building of the new Parliament Buildings, the Governor-General's residence, and hostels and homes for the members and officials. The next Parliament is to meet in the beautiful new City only two years hence. Millions are being spent by the Commonwealth in the building of the most beautiful City in the world.

TO-MORROW.—The possibilities are inconceivable to-day. Men who have penetrated into the heart of Australia can merely hazard a guess at the wealth which lies dormant awaiting development.

At a recent land sale a block of land with a frontage to Castlereagh Street, Sydney, realised **£1,577 per foot frontage,** or nearly **£1,000,000 per acre.**

We are offering quarter-acre building sites in the Canberra Freeholds Estate at **£1 per foot frontage.**

The Canberra Freeholds Estate is the nearest freehold land to the Capital, immediately across the railway line from the Federal Territory, and a few minutes by rail or car.

You can invest in this Estate with safety. Our head office, established in Sydney for 37 years, will watch your interests.

We invite investigation, and will give you every facility.

Shrewd City business men have invested thousands in the Canberra Freeholds Estate.

£60 will purchase a site.

TERMS.—Ten per cent. deposit, balance over 5 years—

at £1 PER MONTH.

Write for plans and particulars and for a few instances of the fortunes made in Australian Cities.

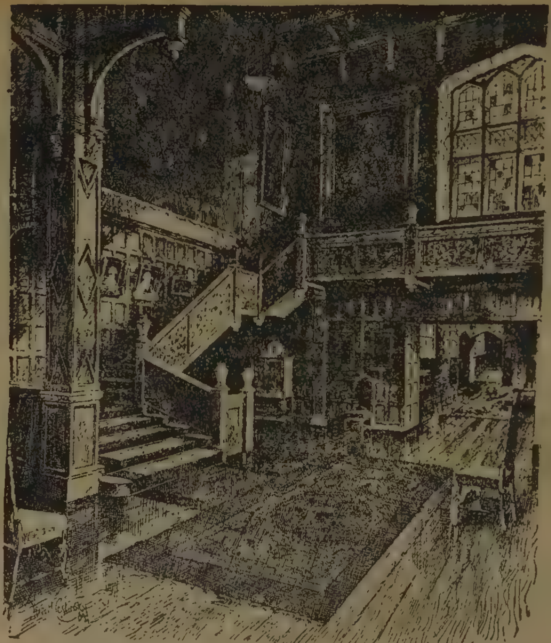
THE HOUSE FOR FINE FURNITURE

BY APPOINTMENT



¶ Our goods make an appeal to all who are interested in securing the best service for Decorating and Furnishing the Home. Enormous selection—Antique and Modern.

¶ "Distinction with Quality" are our watchwords, which is to say that we cater particularly for patrons of exclusive taste who desire their surroundings to reflect their own individuality.

¶ Nor need this involve excessive expenditure. Our large stock of selected Antiques and Choice Reproductions is priced in plain figures for all the world to see, and if we be permitted to design specially made goods, estimates are always submitted when desired. Overseas customers are allowed a cash shipping discount in lieu of carriage paid on Home Orders.

¶ A personal inspection of our extensive Showrooms, covering floor space of over one acre, is best, but post enquiries receive careful attention and when accompanied by details of goods required, photographs of suitable articles are forwarded. No Catalogues.

¶ SPECIALITY: Restoration and Decoration of old Mansions, Furniture, &c.

Mean Longitude of Moon's Ascending Node, January 1, 194° 59′ ♍.

CONJUNCTIONS, ECLIPSES, AND OTHER CELESTIAL PHENOMENA.

January 1. Day breaks 6*h*. 2*m*. Civil twilight ends, 16*h*. 52*m*. Night begins, 18*h*. 5*m*. The length of the day from Sunrise to Sunset is 7*h*. 51*m*.

The ending of Civil twilight is here defined as the time when the Sun's centre is 7½° below the horizon. Day breaks and Night begins when it is 18° below.

Jan. 2, 2*h*. Earth at least distance from the Sun. Perihelion 91,341,000 miles.

Jan. 2. Mars in conjunction with ☽, 15*h*. 53*m*. ♂ 4° 22′ S.

Jan. 3. 19*h*. Mercury at a stationary point.

Jan. 4. Jupiter in conjunction with ☽, 0*h*. 49*m*. ♃ 4° 28′ S.

Jan. 5. Mean time taken by Sun's semidiameter in crossing the meridian, 1*m*. 10·7*s*.

Jan. 7. Mercury in conjunction with ☽, 10*h*. 50*m*. ☿ 1° 33′ S.

Jan. 8. Venus in conjunction with ☽, 20*h*. 25*m*. ♀ 3° 14′ S.

Jan. 13, 4*h*. Mercury at inferior conjunction.

Jan. 17, *aft*. Occultation of Aldebaran and other stars near. See p. 59

Jan. 24, 9*h*. Mercury at a stationary point.

Jan. 25. Mean time taken by Sun's semidiameter in crossing the meridian, 1*m*. 8·9*s*.

Jan. 28. Saturn in conjunction with ☽, 18*h*. 38*m*. ♄ 2° 6′ S.

Jan. 31. Mars in conjunction with ☽, 5*h*. 50*m*. ♂ 4° 52′ S.

Jan. 31. Jupiter in conjunction with ☽, 17*h*. 15*m*. ♃ 4° 30′ S.

Uranus, *Jan.* 1, R.A. 23*h*. 3*m*. Dec. 6° 54′ S. Sets, *Jan.* 1, 21*h*. 51*m*.; *Jan.* 31, sets 20*h*. 0*m*.

Neptune rises *Jan.* 1, 19*h*. 26*m*. *Jan.* 31, 17*h*. 24*m*.

In this month the Mornings increase 25*m*., the Afternoons 45*m*.

Constellations near the South meridian at 22*h*.: Perseus, Taurus, Eridanus, Auriga, Orion, Gemini, Canis Minor, Canis Major.

Note on Tables of Moon Rising, Southing, and Setting.—The times in the second column are those of Moonrise on the day of the month shown by the adjacent figure in the first column, the hours being numbered 0 to 23 from the midnight that begins that day. The figures in the third and fourth columns show the time of the southing and of the setting *which next follow that rising*, and these sometimes happen after midnight which ends the day. In such cases the figures are in heavy type. It is therefore to be remembered, in using this Table, that these distinctive figures always indicate a

MORNING AND EVENING STARS.

☿ **MERCURY** being at Inferior Conjunction on the 13th is an evening star at the beginning of the
nth, but sets less than 1½ hours after the Sun. At the end of the month it rises S.E. by E. about
hour before sunrise.

♀ **VENUS** is an evening star, and may be seen soon after sunset not very high in the south-west
Magnitude − 3·4.

♂ **MARS** is a morning star low down in the south-east about 5*h*. It moves from the constellation
ra into Scorpius, and at the end of the month will be 5° above the red star Antares (Mag. 1·2).
gnitude of Mars + 1·5.

♃ **JUPITER** is also a morning star rising later than Mars S.E. by E. At 6*h*. on the 16th it will be
ew degrees above the horizon, with Mars at greater altitude on its right, and Antares between them
er in the sky. Magnitude − 1·4.

♄ **SATURN** rises in the two hours following midnight. Magnitude + 0·8. It is brighter than the
r Spica (1·2) to be seen on its right, but not so bright as Arcturus (0·2) considerably above it.

(*For note on Magnitude see p.* 71.)

---

e *on the morrow of the day of its line.* A similar system is followed in the Tables of the planets as
y be seen on pages 9 *et seq.*

n these Tables figures are wanting for the day following that on which the Moon rises just before
dnight. The next moonrise happens after midnight of the following day, and is therefore *two* days
ward in the calendar.

The word *Bissextile*, meaning Leap Year, has its origin in the Roman method of enumerating the days of the month (see p. 81). When Julius Cæsar reformed the Calendar in the year 46 B.C. (708 A.U.C.) on the advice of Sosigenes, it was ordained that the additional day should be inserted before (some write *after*) February 24. Now the 24th of February was expressed *ante diem sextum Kalendas Martias* and the intercalated day in leap years was *a.d. bis-extum* Kal. Mar., or, as might be said, the double twenty-fourth. Hence the word Bissextile.

In establishing the new Calendar, it was determined to make January 1 of the Roman year 709 A.U.C. coincide with January 1

* The days thus indicated throughout the Almanack are those on which High Tides may be expected. Strong ortherly winds in the North Sea and a low barometer with heavy rains in the counties drained by the Thames will robably cause a higher rise of the river, and the low-lying riverside districts to be flooded.

MORNING AND EVENING STARS.

☿ MERCURY is a morning star, rising S.E. by E. throughout the month.

♀ VENUS continues to be an evening star. Its time of setting grows later and the planet becomes ghter. It sets due west in the middle of the month and more northward later.

♂ ♃ MARS and JUPITER are morning stars as last month. Mars is now to the left of Antares, and moving towards Jupiter, which it passes on the 13th. Magnitude of Mars, + 1·4 to + 1·1. Of piter, −1·5 to −1·7.

♄ SATURN now rises before midnight. It begins to move in retrograde direction, *i.e.*, westward vards Spica after the 11th.

the year we call 45 B.C., but it was calculated that, according to the system then in vogue, January 1 the year 709 A.U.C. would have happened 67 days before January 1 of the calendar it was proposed adopt. Two intercalary months of 67 days altogether were therefore inserted between the last of November and the first of December of the year 708, which, with an intercalary month of days that had already been inserted according to the old method, gave this year a total of 445 's. The normal Roman year had consisted of 355 days. This year 708 A.U.C. or 46 B.C. is called the ar of Confusion.

The Planets make a somewhat remarkable display in the course of this year. Jupiter and Mars will near neighbours in January and February. Venus will be conspicuous in the evening sky in March, ril and May, remaining above the horizon until nearly midnight. Mars will be unusually brilliant the summer months, whilst Venus will be again of maximum brilliancy in the morning sky in gust, and will rise very early in that month and in September.

The Planet Venus.—Venus will be specially high in the evening sky in the coming months, and will set unusually late. Writing generally, she is high in early evening because the ecliptic is inclined to the horizon at a large angle at sunset in spring, and Venus, like all the planets, is near the ecliptic, and will be far to the left of the Sun, being at greatest elongation East on April 22. Further, she is at the part of her orbit which is highest above the ecliptic, and this with other reasons makes her declination specially large. The occurrence is periodic, and happens every eighth year, *i.e.*, by chance in alternate leap-years.—The planet describes her orbit round the Sun in 224·7 days, and hence 13 of these periods (2,921 days) are almost the equivalent of 8 solar years, and the Earth and Venus have therefore

Time of High Water at the undermentioned Places—

MORNING AND EVENING STARS.

☿ **MERCURY** in the first part of the month rises not long before the Sun. It sets soon after sunset in the last week.

♀ **VENUS** is an evening star, and will be seen soon after sunset south of the west point at altitude about 25°. It is moving northward and eastward among the stars, and at the end of the month will be near the Pleiades and the well-known winter group of bright stars Magnitude − 3·6 to − 3·8.

♂ ♃ **MARS** and **JUPITER** continue to be morning stars and rise nearly S.E. at the times shown. Mars is still moving eastward from Jupiter, which is about ten degrees to the left of Antares. Mars s brightening rather rapidly. Its magnitude changes from + 1·1 to + 0·6.

♄ **SATURN** rises in mid-evening and continues to move slowly towards Spica.

---

the same positions relative to one another and to the Sun after that interval. Venus did not set at Greenwich, as this year, until 8 minutes before midnight in early May of the years 1900, 1908 and 1910. Circumstances are somewhat similar, but not so pronounced, at intermediate dates three years ater, and Venus set about 23*h*. 25*m*. in late May of the years 1903, 1911, 1919.

The planet passes to west of the Sun and will be at Greatest Elongation in September when the Ecliptic is much inclined to the horizon at sunrise. Venus will not have such high declination then as now, but will nevertheless rise early.

Venus is at an epoch of maximum brilliancy about 34 days after Eastern or before Western longations.

The Date of Easter.—Friday, April 18, is the day of the Ecclesiastical Full Moon this year, and Sunday, April 20, is therefore Easter Day. The real Moon is Full two hours after midday of April 19, but the difference of dates this year causes no ambiguity (see p. 82). April 18 is the latest date on which the Ecclesiastical Full Moon can fall, and is known as one of the Paschal Limits, the other being March 21, which is the earliest date, but it happens that for certain reasons, in the current three centuries 1900 to 2199 this Full Moon never occurs on March 21, and Easter cannot fall as early as March 22 during that period (see Tables in Prayer Book). The later limit being April 18 it is clear that Easter is latest (April 25) when the Paschal Full Moon happens on that date, the day being a Sunday. Easter Day fell, as this year, on April 20 in the year 1919, the Paschal Full being on Monday,

MORNING AND EVENING STARS.

☿ MERCURY is an evening star and will be above the horizon for 2 hours after the Sun in the middle April. At 20*h*. on the 16th it will be at an altitude of 8° above the W.N.W. horizon, and there will be an pportunity for seeing the planet by naked eye during the month. It may be seen as early as the 6th.

♀ VENUS will not set until 10 minutes before Greenwich midnight at the end of the month (see 12). It moves through the constellation Taurus, and will add to the usual brilliance of the Spring estern sky. It will be nearly due west at 20*h*., and sets in the N.W. Magnitude − 3·8 to − 4·0.

♂ MARS rises about 2 hours after midnight and at 3*h*. will be about 5° above the south-east horizon. s brightness increases from mag. + 0·6 to + 0·1.

♃ JUPITER rises at midnight early in the month and will be in the south at an altitude of 15° in the wn. In the latter part of the month it rises before Venus sets, and the two bright planets will be en at diametrically opposite points of the horizon.

♄ SATURN, being at Opposition on the 19th, will be above the horizon from sunset to sunrise almost roughout the month.

---

pril 14. It will be on the same date in 1930, when the Full Moon will be on Sunday, April 13. ecurrence of the same date after these short intervals is not unusual, because after five years, of which vo are leap years, or after six, of which one is leap year, the Sundays of the year recur on the same ates and the Full Moons, as above illustrated, fall in the same week of the year. For similar reason even years is a very frequent interval between the occurrence of the same date for Easter. The next ccasion after 1930 when Easter Day will fall on April 20 will be in the year 2003.

The Transit of Mercury.—Because Mercury moves round the Sun in an orbit within that of the Earth it passes periodically between us and the central body. This occurrence is called Inferior Conjunction and happens on the average every 116 days. Usually at Inferior Conjunction the planet passes north or south of the Sun, because the plane of the planet's orbit is inclined to that of the Earth, or the plane of the ecliptic, but when the conjunction happens about May 7 or November 9, which are the dates when the Earth is in the line in which those planes intersect, Mercury will cross the disc of the Sun and be visible upon it as a small black spot, well defined, but not large enough to be seen without a telescope. A Transit of Mercury is of no particular importance astronomically, beyond the fact that the exact time when the planet enters

MORNING AND EVENING STARS.

☿ MERCURY continues to be an evening star for the first few days of the month, and being at nferior Conjunction (see opposite page) on May 8 will be technically a morning star after that date, out will not be visible.

♀ VENUS sets earlier but will be above the horizon until after 23*h.* at the end of the month. Its orightness increases and will be at maximum (Mag. – 4·2) on the morning of the 25th. It will then oe in Gemini, in the neighbourhood of the Twins and Procyon.

♂ MARS rises within the 2 hours after midnight S.E. by E. It is now quite bright (Magnitude + 0·1 to – 0·6) and will be seen about 10° above the south-east horizon in the dawn.

♃ JUPITER rises two or three hours before midnight, and, as last month, will be opposite to Venus n the sky, each planet being a few degrees above the horizon. Magnitude – 2·1.

♄ SATURN in Virgo is above the horizon throughout the short night. Magnitude + 0·5 to + 0·6.

r leaves the Solar disc may be of some value. In the past, Transits of Venus have been considered nportant as means for determining the Sun's distance, but the method is now somewhat superseded. Transits of Mercury in May are more rare than those in November. The last May transit that appened was on May 10, 1891; the next will be on May 6, 1957, but the planet will make a very close pproach to the southern edge of the disc on May 10, 1937. There have been, or will be, transits in November of the years 1894, 1907, 1914, 1927, 1940 and 1953.

Mean Longitude of Moon's Ascending Node, June 1, 146° 56′ ☊.

CONJUNCTIONS, ECLIPSES, AND OTHER CELESTIAL PHENOMENA.

June 1. Civil twilight ends at 21*h*. 8*m*. There is no closed night in this month in the latitude of London. The length of the Day from Sunrise to Sunset on *June* 1 is 16*h*. 14*m*. Its length is nearly 16*h*. 34*m*. from the 20th to the 24th.

June 3, *aft*. Mercury at greatest elongation 24° 15′ W.

June 5. Venus in conjunction with ☽, 15*h*. 22*m*. ♀ 5° 6′ N.

June 5. Mean time taken by Sun's semidiameter in crossing the meridian, 1*m*. 8·4*s*.

June 6, *morn*. Jupiter in Opposition. Nearest to Earth on June 7. Distance 399,580,000 miles.

June 9. Venus at a stationary point.

June 12. Occultation of double star, γ Virginis, by ☽, 30 minutes before moonset. See page 59.

June 13. Saturn in conjunction with ☽, 3*h*. 53*m*. ♄ 1° 54′ S.

June 16. Jupiter in conjunction with ☽, 9*h*. 6*m*. ♃ 4° 11′ S.

June 21. Mars in conjunction with ☽, 15*h*. 16*m*. ♂ 3° 37′ S.

June 21, 17*h*. 0*m*. Sun enters the sign Cancer (Summer Solstice).

June 25. Mean time taken by Sun's semidiameter in crossing the meridian, 1*m*. 8·7*s*.

June 28. A shower of meteors associated with the Pons-Winnecke comet may perhaps be seen.

June 29, *aft*. Daylight occultation of Aldebaran. See p. 59.

Uranus rises *June* 1, 1*h*. 10*m*.; *June* 30, 23*h*. 12*m*.

Neptune sets *June* 1, 0*h*. 12*m*. *June* 30, 22*h*. 16*m*.

In this month the Mornings increase about 7*m*. up to the 17th, and then decrease 4*m*. The Afternoons increase nearly 15*m*. up to the 25th, and then decrease slightly.

Constellations near the S. meridian at midnight: Corona, Hercules, Ophiuchus, Serpens, Scorpius, Lyra, Aquila, Sagittarius.

Longest Day.—This year June 21 will be the longest day. Last year the Summer Solstice happened nearly at Greenwich Noon of June 22, which caused that day to be longer than its neighbours by a few seconds, but the additional day in February of this year has brought the Solstice back in the Calendar by a day, and, as stated, June 21 is the longest day from Sunrise to Sunset at Greenwich. Longitude makes a difference in the date, for the Solstice this year will be in the early ay of

MORNING AND EVENING STARS.

☿ MERCURY is a morning star but rises less than an hour before the Sun and is not likely to seen.

♀ VENUS retains its great brilliancy in the first few days of the month, and will be seen north of est during the evening, but becomes rapidly fainter and sets earlier.

♂ MARS now rises before midnight and will be seen at a low altitude above the south-east horizon the early morning. Magnitude − 0·6 to − 1·3.

♃ JUPITER, being in Opposition on the 6th, is above the horizon from sunset to dawn during this onth. It will be seen between the south-east and south in the twilight. Magnitude − 2·1.

♄ SATURN is now in the south about sunset. It is moving slowly in the direction of Spica, and during e evening will be seen to the left of and at about the same altitude as that star. Magnitude +0·8.

Heliographic Elements.—The second column in the small Table at the bottom of page 2 of ch month shows the position of the Sun's axis of rotation as seen on the disc, the figures giving e arc of the Sun's circumference between the North point and the end of the projection of the is. The third and fourth columns give respectively the solar latitude and longitude of the centre the disc (that is of the Earth), referred to parallels of latitude and meridians on the Sun's surface sed on its axis of rotation and an adopted Prime Meridian. The fourth column shows that with spect to the Earth the Sun rotates on an axis in 27¼ days (see p. 66).

Planetary Conjunctions. — The planet Mars passed through the sky immediately south of Jupiter in the afternoon of February 13 last, the distance between the two planets being then 26′, which is rather less than the breadth of the Moon. Such a circumstance is called a conjunction of the planets and the distance between the two objects may be sometimes more, sometimes less, than that here given, and it is recorded that at midnight of September 13, 1170, the two planets, Jupiter and Mars, were so conjoined that they appeared as one star. MORNING AND EVENING STARS.

☿ MERCURY being in Superior conjunction on the 5th, is an evening star almost throughout the onth, but this will not be a favourable opportunity for seeing it by naked eye.

♀ VENUS being at Inferior conjunction on July 1 is invisible as a naked-eye object in the first part the month, but it may be seen before sunrise in the latter half S.E. by E. Magnitude on July 31, 4·2.

♂ ♃ MARS will be brighter than JUPITER at the end of the month. In the hour or two before idnight, Mars will be in the south-east, Jupiter in the south-west at approximately the same altitude. ie change of relative brightness during the month will be of interest. Computed magnitude of ars, − 1·4 to − 2·3; of Jupiter, − 2·1 to 2·0.

♄ SATURN now sets before midnight. It is still not far from Spica, but has changed its direction motion and is moving eastward. Magnitude, + 0·9.

as a meeting of Venus and Jupiter on February 6, 1892, when the planets were seen as one, but such ose conjunctions are rare. Conjunctions of Mars and Jupiter occur, in general, at intervals of about o days, the last that happened having been on November 26, 1921. Conjunctions of Mars and Saturn cur about every 740 days and of Jupiter and Saturn about every 20 years. These are general figures, t there are rare occasions when three conjunctions of the same two planets happen in the space of a w months. This will be the case for Jupiter and Saturn in 1940-41, and for Mars and Jupiter in the ar 1980. There was a triple conjunction of Mars and Saturn in 1877, and the next will be in 1946.

Mean Longitude of Moon's Ascending Node, August 1, 143° 42′ ☊.

CONJUNCTIONS, ECLIPSES, AND OTHER CELESTIAL PHENOMENA.

August 1. Day breaks at 1*h*. 32*m*. Civil twilight ends at 20*h*. 42*m*. Night begins, 22*h*. 41*m*. The length of the day is 15*h*. 21*m*.

Aug. 2. Mercury in conjunction with ☽, 21*h*. 9*m*. ☿ 0° 55′ S.

Aug. 5. Mean time taken by Sun's semidiameter in crossing the meridian, 1*m*. 6·1*s*.

Aug. 6. Saturn in conjunction with ☽, 18*h*. 19*m*. ♄ 2° 29′ S.

Aug. 7, 11*h*. Venus at greatest brilliancy.

Aug. 9. Jupiter in conjunction with ☽, 20*h*. 13*m*. ♃ 4° 38′ S.

Aug. 14, *aft*. Total Eclipse of the Moon. Partly visible at Greenwich. The Moon rises in Eclipse. See p. 58.

Aug. 15, *morn*. Mercury at Greatest Elongation. 27° 26′ E.

Aug. 15. Mars in conjunction with ☽, 18*h*. 20*m*. ♂ 6° 8′ S.

Aug. 22-23. Occultation of Aldebaran and stars of the Hyades group by the ☽. See p. 59.

Aug. 23, 17*h*. Mars in opposition. Nearest to Earth on Aug. 22. Distance, 34,637,500 miles.

Aug. 26. Venus in conjunction with ☽, 11*h*. 28*m*. ♀ 0° 50′ S. and Occultation of Venus. See p. 59.

Aug. 30, *morn*. Partial Eclipse of the Sun. Invisible at Greenwich. See p. 58.

Aug. 31. Mercury in conjunction with ☽, 15*h*. 13*m*. ☿ 7° 35′ S.

Uranus rises, *Aug.* 1, 21*h*. 5*m*.; *Aug.* 31, 19*h*. 6*m*.

Neptune is absent from the night sky during August.

Meteors of the Perseid stream are expected this month, the nights of most abundance being from the 10th to the 12th. The brightness of the nearly Full Moon may, however, interfere with their observation.

In this month the Mornings decrease 47*m*., and the Afternoons 58*m*.

Constellations near the S. meridian at 22*h*. are those which were in that position at midnight in July.

Brightness of Mars.—The planet Mars, which is at Opposition this month, and therefore in the south at midnight, but even then not very high in the sky, is especially bright this year, and at Opposition is brighter than Jupiter even at its brightest. Apart from its *Albedo*, or the inherent capacity of its surface for reflecting the Sun's light, the brilliance of a planet depends largely on its distance from the Earth, and this for an exterior planet is at a minimum when the planet is in Opposition, which may happen at

☿ MERCURY is an evening star, but is not likely to be visible as a naked eye object.
♀ VENUS rises unusually early, and will be at an epoch of greatest brilliancy on the 7th. Magni-
le −4·2. (*See* note p. 12.) *It moves through the constellation Gemini.*
♂ MARS will be at Opposition on August 23 and consequently will be in the south at midnight. As
ted below, Mars is excessively bright at this Opposition (Magnitude − 2·7) and is now only excelled
brightness by Venus. In the evening it will be possible to compare the brilliance of Mars in the
. with that of Jupiter in the S.W. and later on with that of Venus, which will be in the E. when
rs is in the S.W.
♃ JUPITER is an evening star to be seen in the S.W. It sets before midnight. Mag. −1·9 to −1·7.
♄ SATURN at the beginning of August will be in the S.W. at 20*h.* Magnitude + 1·0.

ious points of its orbit. If Opposition occurs when the planet is near perihelion, its distance from
Earth is small even for Opposition, and on this account and also because it is at nearest to the Sun
s unusually bright. The direction of the perihelion of Mars from the Sun as centre, is that of the
th on August 27, and when Mars is in Opposition about that date the planet is especially near to
and brilliant. Mars is in Opposition this year on August 23, and is nearer and brighter than it
been, or will be, on any occasion in last century or this. The planet was more than usually
ght at the Oppositions in 1909 (September), 1892 (August) and 1877 (September), but these were
elled in the year 1845, when Opposition occurred on August 18, and the brightness was approximately
t of the present year. Sir John Herschel suggested that the red colour of Mars was perhaps due to
rocks like those of the old red sandstone, but more recently attempts have been made to show
t it is due to certain qualities of the Martian atmosphere.

The Harvest Moon.—It will be seen that the interval between successive entries in the column of Moonrise above is less near Full Moon (Sept. 12), than in other parts of the column. The Moon, therefore, full or nearly so, rises at about the time of sunset on successive evenings. This is the characteristic of the Harvest Full Moon which happens this year in September.

The orbital motion of the Moon causes her to move among the stars rather rapidly from West to East, and she comes to the meridian of any place, or is due South, about 50 minutes later night by

MORNING AND EVENING STARS.

☿ MERCURY is neither morning nor evening star in the first part of the month, but in the last
ek it rises 1½ hours before the Sun, and there is a possibility that it may be seen.

♀ VENUS continues to be a brilliant object of the morning sky, rising before 2h. and will be due
t at an altitude of 20° at 4h. At the beginning of the month it lies in the arc joining Procyon to
tor and Pollux, but moves eastward later. Magnitude − 4·0 to − 3·8.

♂ MARS is still a bright object, but is becoming less bright. It will be conspicuous in the
th-east and South throughout the evening not very high in the sky. Magnitude − 2·5 to − 1·8.

♃ JUPITER sets in mid-evening. It will be seen between South and South-west in the late twilight
far above the horizon. Magnitude −1·7 to −1·5.

♄ SATURN is above the horizon for an hour after sunset, and is practically not visible.

nt. For this reason alone she would rise later night by night by this amount, but there is a certain
iod in each lunation when the Moon is moving northward rather rapidly, and this modifies the 50
utes' retardation in the time of rising already mentioned. and in a high latitude the difference
ween time of rising on successive nights at this epoch of northward movement is small. This
pens in every lunation, and in general passes unnoticed; but in the September or October lunation,
e it happens when the Moon is Full or nearly so, the occurrence is striking. It is now not very
nounced, for in some years the retardation is only 9 minutes. The term is always applied to
Full Moon nearest to the Autumnal Equinox, though for certain reasons some other Full Moon
appear to have a better claim to the name. (See October 12.) The Full Moon which follows the
vest is called the Hunter's Moon.

Constellations near the S. meridian at 22*h*.: Delphinus, Equuleus, Aquarius, Capricornus, Pegasus, Andromeda, Pisces, Piscis Australis, Cetus.

Meteors or shooting stars are visible every night in varying numbers and an attentive observer will count between 5 and 15 per hour in clear moonless skies. Occasionally a special shower of these objects is visible, such as on Jan. 3, April 21, Aug. 11, Oct. 20, Nov. 15 and Dec. 10, when they may appear at rates varying between 20 and 250 per hour. At rich periodical returns of the Leonids (as in 1799, 1833 and 1866) great numbers of Meteors are sometimes visible and their apparitions may equal 5,000 or 10,000 per hour to one observer.

October is a favourable month for observing meteors, for they are fairly abundant, generally, and there is a moderately rich display of annual recurrence between Oct. 15 and 25, when the meteors direct their flights from the

MORNING AND EVENING STARS.

MERCURY may be seen due East in the hour before sunrise in the first week of the month.

VENUS is a morning star rising E.N.E. at the beginning of the month and nearly due E. at the end.
moving through the constellation Leo, and will be less than a degree from Regulus in the morning
e 6th and 7th. Magnitude, – 3·8 to – 3·6.

MARS will be seen throughout the evening in the southern sky. Magnitude, – 1·8 to – 0·9.

JUPITER remains above the south-west horizon for 2 hours after sunset. Mag. – 1·5.

SATURN being in conjunction during the month is neither a morning nor an evening star.

h-eastern region of Orion. The radiant point is at about 92° + 15°, and the shower is not visible
after 21h. because this point, which supplies them, is below the horizon in the earlier hours of
evening. The maximum of the shower is usually attained at the end of the third week in October,
it does not assume the importance of a really first-class display such as that of the Leonids or
omedids of November.

eteors which form an important branch of Astronomy were formerly associated with Meteorology,
ough they are undoubtedly of celestial origin they are only visible when traversing our atmosphere.
forcible entry into it occasions the generation of sufficient heat to render them incandescent and
are immediately pulverized. During their luminous flights they are usually between 85 to 25
in height.

brilliant fireball was seen from Cornwall on September 7, 1923, which left a remarkable trail that
ined visible for nearly 10 minutes. The height of the meteor above the earth was computed to
om 68 to 26 miles, and its luminous path 100 miles long. Its velocity was 20 miles per second.

Mean Longitude of Moon's Ascending Node, November 1, 138° 51′ ☊.

CONJUNCTIONS, ECLIPSES, AND OTHER CELESTIAL PHENOMENA.

November 1. Day breaks at 5*h*. 1*m*. Civil twilight ends at 17*h*. 19*m*. Night begins 18*h*. 28*m*. The length of the Day is 9*h*. 37*m*.

Nov. 5. Mars in conjunction with ☽, 19*h*. 51*m*. ♂ 0° 33′ S. **Occultation of Mars, see p. 59.**

Nov. 5. Mean time taken by Sun's semidiameter in crossing the meridian, 1*m*. 7·2*s*.

Nov. 12. Occultation of γ Tauri (mag. 3·9) by ☽. See p. 59.

Nov. 24. Venus in conjunction with ☽, 1*h*. 34*m*. ♀ 2° 56′ S.

Nov. 24. Saturn in conjunction with ☽, 22*h*. 29*m*. ♄ 2° 53′ S.

Nov. 25. Mean time taken by Sun's semidiameter in crossing the meridian, 1*m*. 9·5*s*.

Nov. 27. Mercury in conjunction with ☽, 22*h*. 19*m*. ☿ 6° 26′ S.

Nov. 28. Jupiter in conjunction with ☽, 2*h*. 32*m*. ♃ 3° 43′ S.

Nov. 30. 0*h*. 42*m*. Mercury and Jupiter in conjunction. ☿ 2° 36′ S.

Uranus sets *Nov.* 1, 2*h*. 11*m*.; *Nov.* 30, 0*h*. 16*m*.

Neptune *Nov.* 1. R.A. 9*h*. 39·6*m*.; Dec. 14° 19·1′ N. Rises 23*h*. 37*m*.

In this month the Mornings decrease 49 *m*.; the Afternoons 39*m*.

Constellations near the S. meridian at 22*h*.: Pegasus, Pisces, Cetus, Andromeda, Aries, Perseus, Taurus.

Jupiter's Satellites.—The four satellites of Jupiter discovered by Galileo (see p. 67) are nearly bright enough to be seen by the unaided eye, and it is sometimes said that this has been done, but the fact is doubtful. These Satellites move round Jupiter at different distances from the primary, the orbit of I being the smallest, and that of IV the largest, the direction of revolution being the same as that of the planets round the Sun. Consequently, a satellite when in the part of its orbit between Jupiter and the Earth is seen to move from East to West; when on the side of Jupiter remote from the Earth from West to East. The periods of revolution of these four satellites are 1·77, 3·55, 7·17 and 16·75 days respectively; hence they change their relative apparent positions fairly rapidly, and on the third page of each month their order as seen in an inverting telescope is shown for the moment of the night stated in the heading in the direction W. to E., or left to right as seen in an inverting telescope.

MORNING AND EVENING STARS.

☿ MERCURY will be above the horizon after sunset, but not long enough to be visible.

♀ VENUS is a morning star rising at the times shown. It will be seen in the South-East about 6*h*. fagnitude, −3·5.

♂ MARS is an evening star and will be seen in the twilight in the S.S.E. at an altitude of 20°. t moves Eastward and higher among the stars, and is now less bright than Jupiter. Magnitude, -0·8 to −0·2.

♃ JUPITER will be above the horizon for two hours after sunset at the beginning of the month and or an hour at the end. Magnitude, −1·4.

♄ SATURN is a morning star rising nearly three hours before the Sun at the end of November.

he open circle ○ indicates the planet's disc; the black circle ● shows that the Satellite whose umber is wanting is either in eclipse or is occulted, whilst the sign ♃ shows that it is in transit cross the disc. It will be noticed that at the specified time on August 13, only one of the Satellites, IV,) is named, II and III are in transit and will appear at 20*h.* 59*m.* and 21*h.* 34*m.* respectively, nd I reappears from eclipse at 21*h.* 50*m.* In most case the Satellite whose number is wanting may e more readily inferred. On rare occasions all four Satellites have been known to disappear, the ext being on February 14, 1931. Besides these brighter Satellites five have been discovered in recent ears, all so faint that they can only be seen by the most powerful telescopes.

The Names of the Months which make up the year are rather heterogeneous: some are taken from the names of deities, two are in honour of men, and four are numerical, but the numbers do not agree with the place in the year of the months to which they apply. It is generally believed that these names had their origin in the Roman calendar instituted by Romulus, which consisted of 304 days divided into ten months. Various derivations have been suggested for the names of the first four of these, one suggestion being that the first two, Martius and Aprilis, were named in honour of Mars and Venus. The names of the next two, Maius and Junius, may be corruptions of *majores* and

MORNING AND EVENING STARS.

☿ MERCURY sets more than an hour after the Sun in the first part of the month in the S.W., and nay possibly be visible. At the end of the month it will be neither morning nor evening star.

♀ VENUS is a morning star, to be seen in the south-east about 6½*h*. at an altitude of 15°, but lower t the end of the month. Magnitude − 3·4.

♂ MARS is still a bright object, and will be seen now fairly high in the sky in the south, soon after unset. Magnitude −0·1 to + 0·4.

♃ JUPITER being in conjunction on the 23rd is above the horizon almost entirely in daylight hours.

♄ SATURN is a morning star rising in the E.S.E. at the times shown. It will be in conjunction vith Venus on the 5th, and will be near to and almost directly above that planet. Magnitude + 0·8.

uvenes, the elders of the people of Rome, and the younger, but, on the other hand, they may be erived from Maia and Juno, the names of goddesses. The remaining months were named Quintilis, extilis, September, October, November, December, the ordinal numbers showing the place for the nonth in the year. Numa Pompilius, the successor of Romulus, reformed this calendar and nade the year consist of 355 days by adding two months at the beginning of the year, named respecively Januarius and Februarius, from the gods Janus and Februus. The name of the month Quintilis vas changed to July by Julius Cæsar, B.C. 44, because that was his natal month, and Octavius Cæsar n B.C. 8 similarly altered the name of the following month. All writers do not agree as to details f the early Roman calendar, and its subsequent alteration, but there is little doubt that the twelfth nonth of our modern year derives its name, December, as though it were the tenth, from the calendar f Romulus.

EXAMPLE 1.—Required the time of high water at Aberdeen on *January 8th*:

Time of high water at London Bridge 2*h.* 46*m.* Morn.
Subtract tide interval................ 0 50

Time of high water at Aberdeen .... 1 56 Morn.

EXAMPLE 2.—Required the time of high water at Scarborough on *January 9th* :—

Time of high water at London Bridge 3*h.* 31*m.* Morn.
Add tide interval.................... 2 15

Time of high water at Scarborough .. 5 46 Morn.

It may happen that the "tide interval" to be subtracted is greater than the quantity from which it has to be taken, in which case 24 hours must be added to the London Bridge time; the resulting difference will be the preceding day's afternoon tide where the London morning tide was used. Sometimes the sum "high water at London Bridge"+"tide interval" will exceed 24 hours; in this case, the excess will be the time of high water after the midnight following.

EXAMPLE 3.—Required the time of high water at Aberdeen, *January 19th aft.* :—

Time of high water at London Bridge
on *January 20th* .... 0*h.* 47*m.* Morn.
+ 24 hours = 24 47
Subtract tide interval................ 0 52

Time of high water at Aberdeen, *Jan. 19th* 23 55 After.

Tables for Finding the Times of Sunrise and Sunset.

THIS double entry table provides the means for finding, with sufficient accuracy for practical purposes, the times of sunrise and sunset at any place situated between latitude 60° N. and 60° S.

To use the table: In the horizontal line with the Sun's declination in the first column, and under the required latitude in the heading, there will be found the *local apparent time* of sunset. Subtracting this from 12h. will give the *local apparent time* of sunrise. To obtain from this the local mean time, the quantity in the second column on the second page of each month (which is known as the Equation of Time) appropriate to the day in question must be added to or subtracted from these apparent times of sunrise and sunset, as shown in the heading.

To find the corresponding Greenwich mean time, the difference of longitude of the place from Greenwich must be added if the place be West, subtracted if East.

The table is arranged for northern latitudes, but will serve equally well for places south of the Equator, if the declination North in the first column be considered South, and *vice versâ*.

If the times of sunrise or sunset are required for any declination or latitude falling between the arguments in the table, they may be found by simple proportion.

THE TIME OF SUNSET.

The times of sunrise and sunset given in this Almanack are the times when the centre of the Sun's disc is on the visible horizon at sea-level at Greenwich, computed on the assumption that the horizontal refraction is 34½'. It is doubtful whether there is a precise legal definition of sunrise and sunset. The above has generally been adopted as a correct statement, though in some Tables the instant when the upper limb, or edge, of the Sun is on the visible horizon is given as

the time when the Sun rises and sets. The legal question has been more concerned with the distinction between local sunset and Greenwich sunset, rather than with a precise definition. It has been held by a legal tribunal, as would be expected, that the word "sunset" in laws and regulations must be taken to mean the time when the sun sets at the place in question, whether it be stated in local or Greenwich time.

TO FIND THE GREENWICH TIME OF SUNRISE AT CERTAIN PLACES IN THE BRITISH ISLES IN EACH MONTH OF THE YEAR.

The Table gives the number of minutes to be added to or subtracted from the time of sunrise at Greenwich, to find the Greenwich time of sunrise at the place named in the first column, on the first day of each month. The corrections to be applied on other dates and for other places in the neighbourhood of these may be inferred approximately by interpolation.

The sign + means that the time required is later than that at Greenwich. The sign −, that it is earlier.

If these Tables be considered in conjunction with a map it will be seen that the places at which the Sun rises at the *same* moment lie in a straight line across the map, the lines for different moments being parallel. The lines change their inclination to the meridian throughout the year. Similarly for the setting.

The corrections in Tables II. and III. are always to be added; 1′ is to be subtracted from the final result because the quantities in Table III. above have been increased by that amount in order that they may all be additive.

Solar and Sidereal Time.

TO CHANGE INTERVALS OF MEAN SOLAR TIME INTO THE EQUIVALENT INTERVALS OF SIDEREAL TIME AND *VICE VERSA*.

THE length of a Sidereal day is 23*h.* 56*m.* 4·09*s.* of Mean Time. One hour of Sidereal Time is, therefore, equivalent to 59*m.* 50·17*s.* of Mean Time, and one hour of mean solar time is equivalent to 1*h.* 0*m.* 9·86*s.* of Sidereal Time. This may be expressed otherwise by saying that the Mean Time clock loses or retards 9·83*s.* per hour on the sidereal clock, and that the sidereal clock gains or accelerates 9·86*s.* per hour on the Mean Time clock. These quantities—"acceleration" and "retardation"—are tabulated below for the argument (common to both) in the middle columns. If the argument be considered as Mean Time, its equivalent in Sidereal Time is obtained by adding the acceleration. On the other hand, if it is considered to be Sidereal Time, its equivalent in Mean Time is found by subtracting the retardation.

ECLIPSES IN 1924.

In the year 1924 there will be *five* Eclipses, three of the *Sun*, and two of the *Moon*. All of the Solar Eclipses are partial and visible only from regions round either the North or South Pole, and they are not of interest as subjects for observation. The Lunar Eclipses are Total, but neither of them will be seen throughout all its phases from Greenwich.

I. A *Total Eclipse of the Moon* in the afternoon of February 20. At Greenwich only the latter part of the Eclipse will be visible, for the Moon will not rise there until 17*h.* 23*m.*, which is 26 minutes after the end of totality. The complete phenomenon will be visible from the western part of the Pacific Ocean, Australia and Asia.

II. A *Partial Eclipse of the Sun* in the afternoon of March 5. Invisible at Greenwich. This Eclipse will be seen only from a region round the South Pole, and in no case will more than three-fifths of the Sun's diameter be obscured. At the Cape of Good Hope a partial eclipse will be partly visible. At greatest phase, which will happen at 16*h.* 57*m.* by Greenwich Time, one-fifth of the diameter will be hidden, and the Sun will set as the eclipse ends.

III. A *Partial Eclipse of the Sun* in the evening of July 31. Scarcely a fifth of the Sun's diameter at greatest will be obscured, and this can only be seen from a region in the Antarctic Ocean, south of New Zealand and South America, in which there is no inhabited land.

IV. A *Total Eclipse of the Moon* in the evening of August 14. Writing generally, the Eclipse will be visible from the Eastern hemisphere except its western part, where the beginning will not be seen. The Moon will rise at Greenwich at 19*h.* 20*m.* almost totally eclipsed.

The first contact of the Shadow with the Moon's limb will take place at a point 84° to the East of the North Point, and the last contact at 110° to the West.

V. A *Partial Eclipse of the Sun* in the morning of August 30. Invisible at Greenwich. This Eclipse will be visible from Russia-in-Asia, the northern part of China and Japan, where it happens near sunset. It is also visible from northern Sweden, part of Iceland and Greenland, where the Eclipse will happen at sunrise, but the magnitude of Greatest Eclipse is only 0·426, and the event is unimportant.

Eclipse begins, Aug. 30*d.* 6*h.* 50·4*m.* in longitude 41° 35′ W., latitude 71° 49′ N. Greatest Eclipse, Aug. 30*d.* 8*h.* 22·5*m.* in longitude 173° 5′ E., latitude 71° 32′ N. Eclipse ends, Aug. 30*d.* 9*h.* 55·0*m.* in longitude 129° 23′ E., latitude 41° 5′ N.

VI. The Planet *Mercury will be in Transit* across the Sun's disc during the night (Greenwich) of May 7. The end of the Transit may be seen from Greenwich, for it will happen more than an hour after the Sun has risen there on May 8. The following are Greenwich Times of geocentric phases, that is to say, as they would be seen from the centre of the Earth. The first and second contacts seen from Greenwich will happen about 80 seconds earlier than the times given; the third and fourth about 30 seconds later than the geocentric times.

ECLIPSES OF JUPITER'S SATELLITES.

The following Table gives the times of Disappearance (D.) and of Reappearance (R.) of the Satellites of Jupiter at Eclipse that will be visible from Greenwich in the year 1924. The local mean time of the phase for any place other than Greenwich may be found by applying the longitude (in time) to the times given in the Table, adding if the place is *East* of Greenwich, and subtracting if it is *West*. If Standard Time be required the zone difference is to be treated in the same way; or, in other words, the phenomena of Jupiter's Satellites are seen simultaneously from all places where the planet is above the horizon at the time.

From January to the Opposition of Jupiter (June 5) the eclipses take place on the Western side. In this period I., and sometimes II., disappear by Eclipse and reappear at the Eastern edge. The times of these reappearances after occultation (Oc. R.) are given, the satellite referred to being that *(contd. on opposite page)*

The above is a list of the stars of the 6th magnitude (to mag. 6·2) and brighter that will be seen occulted from Greenwich during the year, with the times of disappearance and reappearance. The occultations if seen from other places will be *in general*, earlier if the place is West, later if it is East. Disappearances usually happen on the East or left-hand side of the Moon, reappearances on the West; the exact position is shown by the angle from N. Point, or the point of the Moon's disc nearest the Pole of the heavens, counting towards the East from 0° to 360°. Occultations of Aldebaran on several occasions are to be noted, also those of Venus and Mars. The well-known binary star γ Virginis, is occulted on two occasions, but on both the star is very near the horizon. BD +14° 657 and −7° 3728 are also double stars.

of the preceding line. From June 5 to October, Satellites I., II. and III. disappear in some cases by occultation at the Western edge, and reappear after eclipse on the Eastern side. The times of these disappearances by occultation are given (I. Oc.), the reappearance at eclipse being in the following line. There are no eclipses of Satellite IV. in the list. In alternate periods of about 3 years this satellite is not eclipsed nor occulted, nor is it seen in transit across the disc of the planet. The present period of non-eclipse began at the end of the year 1921. The first eclipse of the next period will be on February 19, 1925.

The position of a star is defined by its Right Ascension and Declination, which are analogous to longitude and latitude on the terrestrial sphere. For certain causes, known by the word Precession, the lines of reference on the celestial sphere are continually changing, hence these co-ordinates, Right Ascension and Declination of each star change, each by the annual amount shown in the Table. Observations of position of the stars show that they do not conform precisely to this change by precession, and the outstanding amount different for individual stars, known as Proper Motion (see page 64) is also shown. The angular parallax of a star is inversely proportional to its distance, it being the angle that the mean radius of the Earth's orbit would subtend at the distance of the star. The parallaxes in the adjoining table have been collected from various sources, a few of them being spectroscopic. The entry 000 indicates that attempts to find the parallax have shown that the star is very distant, and that no trustworthy figure could be assigned. For a few stars no value is available. The last column shows the distance from the Sun corresponding to this parallax in parsecs. A parsec is equivalent to about twenty billion miles.

There are in the list certain stars which are double, and in general the Mean place given for these is that of the brighter star, and the figure affixed to the Greek letter shows whether this is the first or second

in order of Right Ascension. In the case of Castor (α² Geminorum) the second of the components is the brighter, and the place of this is given. Sirius, Procyon, which have faint companions, and α Centauri are binary stars, and of these the Mean place given is that of the centre of the orbit.

These tables give Mean places. The position on any day of the year differs from this because of Precession, Nutation, Aberration and Proper Motion. The Mean place with these effects added is called the Apparent place, and for the purposes of navigation and surveying it is the Apparent place that is required.

The Stellar System.

THE objects of the sky, Sun, Moon, Planets, Stars, appear to us to be fixed on the interior surface of a hemisphere of which the observer is the centre. Actually the different classes of objects are at very different distances. The stars are the farthest away, and individual stars are at great and very various distances from us, and are themselves separated from one another by equally large distances. The nearest star to the Sun is nearly ten thousand times as far from it as is the planet Neptune. It is the purpose of modern astronomy to investigate the method of distribution of these bodies in space, and their possible movements. There are about 10,000 stars visible to the naked eye in the whole celestial sphere, the number including the cases where two or more faint stars close together combine to form one which is so visible. The number naturally depends on the efficiency of the observing eye and the clearness of the atmosphere, and the estimate will be less generous if stars to magnitude 6·0 and no fainter are included, which is sometimes taken as the limit of naked-eye visibility. The whole number of stars down to this limit of magnitude is 4,300, of which more than 3,000 are visible during the year from latitude 60°. By the aid of the photographic plate objects are detected and recorded which no eye can see, even with the best optical aid. One hundred millions is an under-estimate of the number of stars already photographed, and it may be supposed that this number would be much increased with increased exposure, though 2,000,000,000 has been assigned as a limit to their number. The Yerkes telescope, whose object glass has 40 inches diameter, will just show stars of the 17th magnitude. A star of magnitude 21 has been photographed.

STRUCTURE OF THE UNIVERSE.

It is believed that the mass of the stars we see as separate entities are arranged in space in a form which may be likened to a watch or lens. In other words, the stellar Universe is considerably flattened on both sides, the median plane being marked out in the sky by the band of star cloud of irregular shape which is seen crossing the sky on a clear night, known as the Milky Way or Galaxy. This follows from star-gauges, or counts, which show that the stars are more dense in the direction of the central plane, called the Galactic plane, than elsewhere. On either side of this the stars lie thick, but the number becomes progressively less as the distance from that plane increases, until at its poles they are relatively few. The Milky Way is seen to consist of clouds of faint stars, of star-clusters other than globular, and gaseous nebulae (see p. 64). It is also the location of an early type of stars known as Wolf-Rayet and Novae. This galaxy was formerly pictured as a girdle made up of these bodies, surrounding the lens-shaped system of stars, and at a distance from the Sun of the order of 3,000 or 4,000 light years. The Sun is not supposed to be precisely central, but nearly so. A recent description (Shapley) of the structure of the Universe dispenses with the idea of an actual girdle; and affirms that the members of these classes, and also the globular clusters, which are not seen within the limits of the Milky Way, form an aggregation, which is named the Galactic system. A class of objects, known as White or Spiral Nebulae (see p. 64), which are seen in directions other than Galactic, and are very distant, may not form part of this aggregation, but may be "Island Universes," though this is a matter for discussion. The size of the Galactic system is almost conjectural, but according to Prof. Harlow Shapley its greatest diameter is of the order of 300,000 light years, and its dimension at right angles to the galactic plane a twentieth of this, so that the aggregation is extremely flattened. An opposite view estimates the dimensions at about a tenth of these. The great majority of the nearer stars to the Sun are members of a local flattened cloud, or cluster, which has a greatest diameter of the order of 6,000 light-years. It is recognised that in the space which comprises the Universe of stars there is dark obscuring matter which it is suggested is the cause of some of the dark patches in the Milky Way. As seen in the sky the Galaxy always passes through the same constellations, sharing with them the diurnal motion, but its direction bears no special relation to the direction of the Ecliptic, Equator, or horizon. Such a relation is not to be expected, for these three planes pertain only to our Sun and Earth, which are minor bodies of the Cosmos of which the Galaxy is a main outstanding feature.

SIZE OF THE STARS.

The stars are too remote for even the largest to show an appreciable disc in any telescope as do the planets, and obviously it is impossible to estimate the size of a star from its brightness, as we see it, for this depends on its distance, and on its intrinsic brightness, which may depend on its temperature or other physical condition. A recent theory of stellar evolution (*q.v.*) involves the idea that the stars are of very different size and luminosity, some being known as "giants," others as "dwarfs." It has been found, with some probability, that the surface brightness of a star has a relation to its spectrum (*v. infra*), and, assuming this, the angular diameter of a star is to be found by dividing its total brightness by the surface brightness per unit area, which last is shown by its spectrum. A more direct way has, however, lately been found, and, by utilizing an optical principle proposed many years ago by Fizeau, and elaborated independently by Michelson later, an apparatus known as an "interferometer," has been invented and constructed for the purpose. With this the angular diameter of Betelgeuse, the well-known red star in Orion, has been measured as 0·″047 and, adopting 0·″018 as the parallax, the diameter of this star is found to be 240 million miles. The diameter of Arcturus, measured in the same way, was found to be 0·″024 in angular measure, which corresponds to 19 million miles linear. Antares was similarly found to have an angular diameter of 0·″040, and, since 0·″030 is an extreme value of its parallax, its diameter is at least 120 million miles and may be much larger. It is satisfactory that these angular diameters agree closely with the value derived from consideration of the assumed surface brightness of each star.

ABSOLUTE MAGNITUDE.

This phrase is much in use in the astronomy of the present day, and implies the luminosity of a star irrespective of its distance. The precise definition of absolute magnitude is that it is the number that expresses according to the usual system of stellar magnitude (*see* p. 71) the brightness of the star as it would be seen at the

The last column of each table shows the brightness, irrespective of distance, compared with that of our Sun, which is taken as a star of apparent magnitude −26·57 on the stellar scale. A star marked thus * is the brightest component of a binary or multiple system. The first star in the list seems to be physically connected with the α Centauri system. Munich 15040: The proper motion of this star 10·3″ per year is the greatest known. It is probably the smallest star known. The distance of ϵ Indi is from a recent spectroscopic determination.

distance of 10 parsecs (parallax 0·1″). It is clear that if the distance of a star is known, its absolute magnitude can be computed from its apparent, *or* by reversing the formula, if the absolute and the apparent magnitudes are known, the distance of the star can be determined.

DISTANCE OF THE STARS.

The distance of the stars from us is so immense that its determination is perhaps the most difficult problem of astronomy, and not until comparatively recent years has it been effected in any quantity and with much certainty. The direct method of determination of a star's parallax, as this quantity is called, consists in measuring the minute difference of direction of the star as seen from opposite points of the Earth's orbit, which is now usually done by photographing the star and its surroundings at appropriate epochs and finding by measurement the change of position of the stars with relation to its neighbours. A spectroscopic method of finding parallax through the absolute magnitude has been evolved. It has been found that in the spectra of stars the ratio of the intensity of certain pairs of lines is a function of the absolute magnitude. In stars intrinsically brilliant for example, a certain Calcium line is very strong whilst a line due to Iron is very weak, whilst in an intrinsically faint star the case is exactly contrary. This principle has been adopted, and by help of the spectra of stars whose distance has been found trigonometrically it is found possible to infer the absolute magnitude of a star from examination of its spectrum, and hence its distance. These methods are now being pursued with vigour, and by means of these, and some other less direct methods, the distances or parallax of more than 3,000 individual stars are now known. If by any means it is possible to find out the mean parallactic movement (see *Stellar Motion*) of a group of stars the mean parallax or distance of this group follows from a simple computation. In other words the space through which our Sun travels, which is about twice the diameter of the Earth's orbit in a year, is taken as the base-line with which to measure the distance of the stars.

The distances of many of the stars are given in the lists on pages 60 and 61. To express these large distances a large unit is required. One of these is the space that light moves through in one year, which in miles is 6 followed by 12 zeros; another unit is the *parsec*, or the distance at which the mean radius of the Earth's orbit would subtend an angle of 1″ (parallax = one second). This is 3¼ times the light year and is represented roughly by 2 followed by 13 zeros. There is also a unit little used called the *Siriometer*, which is equivalent to a million times the distance of the Earth from the Sun.

STAR SPECTRA.

Most of the bright stars and many of the fainter have been examined with a spectroscope, and have been divided into classes according to their type of spectrum as indicated by the lines which cross them, the spectral types being named by the letters O, B, A, F, G, K, M, N. The stars of the first two classes, O and B, have spectra characteristic of helium and hydrogen, and have some affinity to planetary nebulæ. Stars whose spectra range between A and F—and it is to be remarked that there is no rigorous line of division between the classes—are white or blue stars, and in their spectra broad absorption lines of hydrogen are conspicuous. In the next groups—F to G, and G to K—lines characteristic of metals appear, fine but numerous, and the stars of this class are yellow. The spectrum of our Sun falls within the group F to G. The characteristic of the spectra of the remaining classes, M (and N), is the existence of a considerable number of flutings, and the stars are red. Antares, Betelgeuse, and α Herculis are notable stars in sub-classes of this type. (*See* Table above.)

STELLAR EVOLUTION.

It is realised that the spectrum of a star shows not only the materials of which it is composed but also its physical condition. Stars of the M type are of low temperature, whereas those of A and B are hot stars. This has led to hypotheses of stellar evolution, but whereas it has been supposed that each star passed through stages from hot to cold as indicated by the order of spectra shown above, a recent theory affirms that a star begins its existence as a large cool body (Giant star Type M) and after increasing in temperature and density through the types K, G, F, A, B, passes with diminishing temperature and decreasing volume in reverse order through the types to become a Dwarf Star of the M type. This theory, which resembles in some respects one propounded by the late Sir Norman Lockyer, is in its present form the result of researches on stellar masses and magnitudes by Prof. H. N. Russell, of Princeton, U.S.A.

STELLAR MOTION.

Many, if not all, of the so-called Fixed Stars are gradually changing their positions relative to one another, the movement of each star being called its Proper Motion. Consideration of these proper motions has led to the conclusion that they are in part due to an actual movement in space of the star itself, but in part to the movement of our own Sun, which causes an apparent motion of the star in the opposite direction, this latter being called the star's parallactic motion. In this way, it has been found fairly conclusively that the Sun, and with it the Earth and planets, is moving through space with a speed of 19·5 kilometres per second towards a point on the celestial sphere not far from the bright star Vega, speaking roughly, but there are differences in the determinations of the position of this point. The Proper Motions of Stars of spectral type F and G are found to be much larger on the whole than those of other types, and it is therefore to be supposed that these classes are nearest to us. It has already been mentioned that our Sun is of this spectral type.

STAR CLUSTERS AND NEBULÆ.

Among the other apparently solitary stars we may notice groups of stars gathered close together, sometimes easily separable into individual stars, others that can only be separated in the most powerful telescopes, and some that appear as unresolvable patches of light; the latter are called nebulæ, and were aptly described by Sir William Herschel as "shining fluid." A short list of the more interesting of these various objects is given herewith.

7078	M 15	21 26	+11 49	Pegasus	Magnificent cluster of stars.

Besides the obvious separation into these two classes there is further subdivision. There are loose clusters of stars of which the Pleiades is the best known example, and there are globular clusters whose character is described by their name. Among the nebulæ there are some that are small, regular in outline, and show a uniform disc of light known as planetary nebulæ, and analogous to these are some which are dark in the centre called annular or ring nebulæ. Beyond this the spectroscope divides the nebulæ into two great classes. The first spectroscopic observation of a nebula, made by Huggins in 1864, showed a spectrum of one bright line only, which indicated that these bodies, or at least some of them, are constituted of glowing gas. Later investigation showed that the spectra of some nebulæ are continuous, from which it may be inferred that these are in a later stage of progress, assuming the evolution of celestial bodies from a primitive nebula. The nebulæ with continuous spectrum are called "white" nebulæ, in distinction to those with bright line spectra, which are "green" or gaseous. Photography has brought the means of studying the number and form of these objects in great detail, and it is found that the white nebulæ are as a rule of a spiral form, and that there are many thousands of them. The gaseous green nebulæ are in a small minority. The great nebula in Andromeda is a notable example of the spiral class. Its spectrum is perfectly continuous, unmarked by any lines or bands, either bright or dark, and its shape is that of a convoluted mass seen edgewise. The position of these bodies and the method of their distribution in space have already been mentioned (*see* p. 62). The larger gaseous nebulæ lie mostly in the Milky Way, and the smaller, the so-called planetary and stellar nebulæ, though they do not do so entirely, do not markedly avoid it as do the spirals which lie in a zone of the sky, roughly at right angles to the Galaxy.

VARIABLE STARS.

Although the stars generally shine with unchanging brightness, there are some among them which are exceptions to this rule, and of these Algol, the star β of the constellation Perseus, is the best known. In general this star is of about the second magnitude, but at regular intervals of something less than 69 hours it fades away to between third and fourth magnitude, remains so for about 20 minutes, and then regains its light. The whole eclipse occupies about 9½ hours. The approximate times when this star will be at minimum in the months when it is suitably placed for observation are given in the table above. The position of Algol is given by R.A. 3*h.* 3*m.*, Declination 40° 39′ N.

There are variable stars of types other than the Algol. The Cepheid variables have an average period of about 7 days, and the rise from minimum to maximum takes only about one-third of the whole period, so that the decrease of light is more gradual than the increase. Stars of the β Lyræ type pass from minimum to minimum in about 6½ days, but are not of the same brightness at all minima, the alternate being equal. There are variable stars of long period (about 330 days) of which Mira Ceti is the most famous and others more capricious in their variation whose peculiarities can scarcely be summarized. Mira Ceti (R.A. 2*h.* 16*m.*, Declination 3°. 19′ S.) will be at maximum at the end of January, 1924, and again at the end of December. This star remains at naked-eye visibility for about three months, and there will be opportunity for its observation at the end of the year though precise details are uncertain.

The variation of stars of the Algol type is believed to be caused by the partial eclipse of the bright star by a dark companion which moves in an orbit round it. A secondary minimum that has been noted in the period of variation of Algol can be accounted for by this theory. The variation of the Cepheid variables, on the other hand, is not caused by eclipse, though many of them have been found to be binary stars. It has been suggested that it may be due to a pulsation or periodic swelling and contraction of the star. A curious relation has been found between the absolute magnitude and the period of variation of Cepheids, those of longer period being the brighter

NEW OR TEMPORARY STARS.

The phenomena known as "Novae" or "New" Stars can scarcely be classed as variable stars, for the rise to maximum, so far as is known, occurs only once in their history. Generally the Nova appears in the place of a star of faint magnitude which may have blazed out into conflagration, or as an alternative theory a mass of dark nebulous gas may by some means have become igneous. The great brilliancy which occurs very suddenly, is short-lived, for there follows a rapid fall, and in a few months the object emits, perhaps, 1 per cent. of its light, whilst in a decade it has fallen to its original condition and luminosity. As these changes go on the spectrum undergoes equally remarkable variations. The few observations that have been made during the increase of brightness show a spectrum of the ordinary type crossed by dark lines which are much displaced from their normal position. Just as the maximum light is reached the spectrum is full of bright bands flanked by dark lines on the side of the shorter wave length towards the violet. The lines of hydrogen are most conspicuous, but helium is present, and other bands can be identified with enhanced lines or lines which are produced in the laboratory when metallic vapour is very strongly excited to luminosity by a powerful electric spark. Later on as the light begins to fall the characteristic nebular lines in the green and violet make their appearance and become the most conspicuous feature of the spectrum while the other lines fade away. At a still later stage the spectrum resembles that of the nucleus of a planetary nebula or of one of the Wolf-Rayet stars which are found here and there in the Milky Way. Below will be found a list of the Novae (12 in number) that have been visible to the naked eye since 1848. In the year 1923 a New Star or a rapid increase and decrease of brightness of a star in Cygnus was reported; also a sudden brightening of β Ceti; but these were not observed sufficiently to be placed permanently on record.

The Solar System.

THE Sun is one of the millions of stars that make up the Universe, and, so far as human knowledge goes, is not unlike many of the stars we see in magnitude and constitution. It is surrounded by a family of smaller bodies of which our Earth is one, and the Solar system, which is only a minute detail in the structure of the Universe, is the observing station from which we look out in all directions across the great distances which separate us from the other members of the stellar system.

The Solar or Planetary system consists of the Sun, with eight major planets and a thousand minor planets, or asteroids, circulating round him at varying distances in oval-shaped orbits. Six of the major planets have smaller bodies circulating around them, so that each forms a separate system, but all the bodies receive their light and heat from the Sun.

The periodic comets which return to perihelion at regular intervals, since they move in elongated elliptical orbits of which the Sun is at one focus are also members of the Solar system, but shine partly by their own light.

The plane of the Ecliptic in which the Earth moves round the Sun (*see* p. 75) is used as a fundamental plane of reference. The other planets move, at varying distances from the Sun, in planes inclined but little to the plane of the Ecliptic, and describe orbits in periodic times which are connected with the distances by a certain relation known as Kepler's 3rd law. The squares of the periodic times vary as the cubes of the semi-major axes. Following are given brief notes on each of the bodies which make up the Solar system, with details of their sizes, distances from their primary, and periodic times in tabular form. The time of rotation about the axis, or the length of the day of the planet, is added where this is known.

THE SUN.

The surface of the Sun, seen in a telescope, presents a mottled appearance formed by a darkish background on which small brilliant patches are scattered, the shape of these being such that they have been called alternatively rice-grains or willow leaves. On this surface black spots appear sporadically, and around these are brilliant streaks called faculae, which are conspicuous when the spots are near the edge of the Sun. Associated with the faculae there are brilliant clouds of calcium vapour that are revealed by the spectroheliograph, an instrument by means of which the whole of the Sun's disc may be photographed by the light of any element, and of that element only. The nature of the spots is not known with certainty. Formerly they were thought to be saucer-shaped depressions at a lower level than the surrounding surface, which is called the photosphere; modern views describe them as columnar vortices which have a deep-seated origin far below the photosphere, and assume that a sun-spot is a vast tornado in which electrified particles are rapidly whirled. This view is confirmed by the invariable presence of a magnetic field in the neighbourhood. There is apparently a connection between the solar activity, as shown by the spots, and terrestrial magnetism for the coincidence in time, between certain exhibitions of its variations and the appearance of sun-spots is too marked to be fortuitous. It is suggested that the connection is made by stream-like emanations of corpuscles from the Sun which envelop the earth. The spots vary in size and number, and their total area reaches a maximum about every eleven years. They seldom appear more than 30° of latitude from the solar equator, north or south, and the spotted regions converge towards that equator as minimum approaches. From measures of their position the latitude and longitude of the spots on the Sun's surface (Heliographic) can be computed. Elements necessary for this computation are given on page 2 of each month. The Sun rotates on its axis in about 25 days 9 hours, which is shown by the apparent movement of the spots. They cross the visible disc from the eastern to the western edge in 13 or 14 days, the average period of the Sun's rotation with *respect to the Earth* being 27¼ days, because of the orbital movement of the Earth in the interval. Like Jupiter, the Sun appears not to rotate as a whole, the period of rotation being different in different latitudes. The Equator makes a sidereal rotation in less than 25 days, whereas the period for latitude 35° is nearly 27 days. As may be inferred from the table below the cycle is now about at its minimum. There was a small spot in a high solar latitude in June, 1922, which is always a precursor of a new cycle, and the appearance of a group in 29° S. in September, 1923, and of others later, may establish the minimum about the middle of the year 1923.

When the intense light of the Sun is shut off by the interposition of the dark body of the Moon in a total solar eclipse, certain red prominences are seen projecting from the Sun's edge, which consist of masses of glowing hydrogen gas arising from the chromosphere. Sometimes these are of remarkable shape and extend to enormous heights, occasionally being detached from the body of the Sun. In the lower strata of the Sun's envelope are found the vapours of many metals, known by their characteristic lines shown in the spectroscope. Another appendage to the Sun outside the chromosphere, called the Corona, can only be seen during total eclipses. The lower portion of the corona consists of a pale green light containing hydrogen, the upper is a beautiful mass of silvery white light, in form of feather-like plumes, with dark spaces between, which have been traced from the Sun's edge to a distance as great as twice the Sun's diameter. Occasional streamers of the corona have been followed to a greater length than this. The corona does not retain a constant form, but appears to vary in shape and extension according as the eclipse occurs at the period of maximum or minimum of Sun-spots. Solar eclipses are only seen total at places where the shadow of the Moon falls, and an eclipse is partial at localities off this line of totality, because the change in the observer's position puts the Moon out of the direct line joining her to the Sun. Total eclipses of the Sun are rare in this country. There will be an eclipse on June 29, 1927, which will be momentarily total from a track running across North Wales and North-West Yorkshire.

MERCURY.

Mercury is the nearest planet to the Sun, and the smallest in the system. Because it moves in an orbit between the Sun and the Earth this planet can never be seen far from the former body, and is sometimes to the West, sometimes to the East of the Sun. In the former case Mercury appears as a morning star and in the latter as an evening star. The extremes of these apparent excursions are technically known as Elongations, and the times and distances, measured by the angle included between the lines which join the Earth to the Sun and the planet respectively, are given in the third page of each month. The great ellipticity of the orbit of Mercury causes the amount of these Elongations to vary considerably, and they may be as small as 16° or as large as 28°. The period of revolution round the Sun—in other words, Mercury's year—comprises 88 solar days, and he turns on his axis either in the same time, and therefore always presents the same face to the Sun, like the Moon with respect to the Earth, or in about 25 hours. Mercury shows phases to the Earth—like the Moon in her first quarter if the elongation be in the East, and like her last quarter if in the West. (See pp. 20 and 71.)

VENUS.

Venus, which is nearly twice as far from the Sun as Mercury, is almost exactly the same size as the Earth. Her apparent movement with respect to the Sun is similar to that of Mercury, except that, being farther from the Sun, and nearer to the Earth than her smaller neighbour, the angles of Elongation exceed those of Mercury, and extend to 47°. The disc of Venus is not telescopically interesting, for owing to her dense cloud-laden atmosphere very few markings are visible, and this renders a determination of her axial rotation uncertain. By some astronomers her day is believed to be very nearly equal to that of the Earth, whilst others have concluded that it is equal to the year of Venus, or, in other words, that the planet always presents the same face to the Sun. Venus has epochs of great brilliancy when she appears as a beautiful crescent like the Moon when about 5 days from or before New. There will be occasions of this kind on May 25 and Aug. 7, 1924, and Venus will be brilliantly visible as an evening star in the spring months of the year, and as a lustrous morning star in the summer and autumnal months. (See p. 12.)

MARS.

Mars, the first planet whose orbit is exterior to that of the Earth, is a little larger than Mercury and considerably smaller than Venus and the Earth. Details of his distance and period will be found in the table. Mars is in opposition at intervals of about two years, because it moves at a rate not greatly different from that of the Earth. There will be an exceptionally bright Opposition in August, 1924 (see p. 32). Mars, like Mercury and Venus, exhibits phases, but in a much less degree than those planets. His disc departs from exact circular form, or is gibbous only to the extent of one-eighth of its diameter. The other superior planets are too far away to show any very appreciable phase, though traces of it are sometimes to be detected in the disc of Jupiter.

Unlike Mercury and Venus, Mars exhibits many well-defined markings, which enable his rotation period to be well ascertained; there are, besides, white spots at the poles of rotation. These are supposed to consist of snow, and when it is summer to the Martians in the northern hemisphere, the white spot about that pole dwindles considerably in extent, if it does not disappear entirely, which it does rarely. The remainder of the disc is divided into greyish and ruddy areas, which have been called seas and lands. The dark grey patches are now not considered to be oceans, but are usually regarded as marshes or areas covered with some sort of vegetation. These areas are seen to change their colour and intensity with the Martian seasons very much as our vegetation would appear to do if viewed from a celestial neighbour. Certain fine, dark, straight markings seen across the ruddy areas have been named "canals," perhaps a little unfortunately, as it has been taken to imply that they are of manual construction, but for this there is no sufficient evidence or proof.

MINOR PLANETS.

Between the orbits of Mars and Jupiter a large number of small planets have been discovered, and every year a considerable number are added to the list. At present the total number known is about a thousand, and there may still be thousands awaiting detection. The four largest found in the early years of the 19th century, are—Ceres, 485 miles; Pallas, 304 miles; Juno, 118 miles; and Vesta, 243 miles in diameter. Vesta is the brightest though not the largest. In recent years the discoveries have been of much smaller objects, and it is probable that some of them are not more than from 10 to 20 miles in diameter, and are perhaps nothing more than great masses of rock flying round the Sun.

The periodic times of their revolutions vary considerably, and an average may be taken as 1,600 days, or 4½ years. Some of the orbits are very oval, and the inclination of their planes to the Ecliptic has considerably different values. The inclination of Pallas is 35°, whilst that of Juno is only 13°. One of these small bodies, named Eros, at some oppositions approaches nearer to the Earth than Mars does at any time, and this affords a good opportunity for determination of the solar parallax. Oppositions happen at intervals of about 2⅓ years, the circumstances being very different at the different occasions. Eros will be in Opposition on March 31, 1924, and nearest the Earth on March 5, when the distance will be about 33 million miles. There will be a very close approach in 1931, when the distance will be about one half of this.

JUPITER.

The next planet in order from the Sun, Jupiter, is the largest in the system, and has a diameter eleven times that of the Earth. Its density, however, is only ¼th that of the latter. On viewing Jupiter through a telescope it will be seen that the disc is not circular, but its form, an oblate spheroid, is believed to be due to the rapid axial rotation, which causes a flattening at the poles and bulging outwards at the equator. The same effect is produced on all the planets in more or less degree. Jupiter has four principal satellites about the same size as our moon, which were the first celestial objects discovered with the telescope, Galileo having observed them in the year 1610. The planes of their orbits are but slightly inclined to that of Jupiter about the Sun, and in consequence these bodies which shine by the light of the Sun, are eclipsed every Jovian lunation, except Satellite IV., which escapes under some circumstances (*see* p. 59).

The surface of Jupiter presents features of interest because of their varying changes, though at the same time they possess considerable permanence. Of these the best known is the Great Red Spot and its surroundings. There are records of an observation of a spot by Hook in 1664 which may have been an early appearance of this, but the first modern observation was by the Rev. W. R. Dawes when he figured it in the form of an ellipse resting on the south equatorial belt of Jupiter on Nov. 27, 1857. It came again into prominence in 1878 and the following years. A curious bay or hollow in this belt has been visible since 1831; and if we accept this as identical with the one now intermittently perceptible (which includes the red spot), then the rotation of this object during the 89 years from 1831 to 1920 was 9*h*. 55*m*. 36·9*s*. from about 78,500 rotations.

In the early months of 1919 the great red spot and its immediate surroundings underwent some surprising changes. The bay or hollow in the S. side of the southern equatorial belt disappeared, and the red spot seemed almost obliterated. The south tropical disturbance, visible since 1901, consisting of an extensive dusky marking reaching halfway round the circumference of Jupiter, and situated in the usually bright zone between the southern side of the south equatorial belt and the south temperate belt, apparently disappeared. The apparition of 1919-20 was again remarkable. The features mentioned above, the Bay, the Red Spot Hollow, and the S. Tropical disturbance, had all reappeared, and the Red Spot, though without its colour, was well defined.

At the opening of the year 1924 the position of the latter object will be approximately 150°, or a little more than 4 hours, preceding the zero meridian (System II.) of Jupiter, and if the previous motion is continued, the values above given will increase at the rate of about 2°, or 3 minutes per month. There is much to repay a careful study of the portion of Jupiter's surface referred to through adequately powerful telescopes. The transits of the zero meridian (II.) of the planet on various dates in 1924 will be as under in astronomical time:—

May	8	17	56	Sept.	1	13	41
,,	10	19	34	Oct.	2	14	26

The times for other dates may be found by adding periods of 9*h*. 55*m*. 40*s*.

Note.—Two systems are in use for defining the positions of markings on Jupiter. In System I., which pertains to the rapidly moving Equatorial Zone of the planet, the period of rotation is taken as 9*h*. 50*m*. 30*s*. System II. applies to the Temperate Zones, and in this the time of rotation is 9*h*. 55*m*. 40·63*s*.

It is to be remembered that in March, 1924, the Red Spot will come to the Central Meridian of Jupiter about 4*h*. 15*m*. before the times given in the foregoing list, and that this interval of the precedence of the spot will probably increase by about 3 minutes per month.

SATURN.

The sixth major planet in order from the Sun is unique in appearance because of its encircling ring-system, which renders it magnificent as a spectacle and an interesting object for telescopic observation. The system consists of two bright rings and an inner dusky ring through which the body of the planet can be seen. A marking on the outer ring known as Encke's division is sometimes seen, but it is doubtful whether this is a real separation. The rings appear to be flat annular discs of extreme thinness, inclined at an angle of 28° to the plane of the Ecliptic, and it is shown that neither of them can be a coherent mass or in one piece, either solid or liquid, as in that case it would be difficult to account for their stability. They probably consist of an immense number of minute bodies revolving like satellites round the body of the planet. Belts like those on Jupiter, but of not so pronounced a character, are seen on Saturn. His figure shows a bulging at his equator, the ratio of the polar to the equatorial diameter being as 13½ to 15.

Saturn has ten satellites, situated outside the rings; some of the former are visible in telescopes of low power. Titan, the largest, is about one and a half times the size of our moon, whilst Iapetus is about the same size as our satellite.

Titan was discovered by Huyghens in 1655, Tethys, Dione, Rhea and Iapetus (*see* table p. 70) by J. D. Cassini towards the end of the 17th century. Sir Wm. Herschel discovered Mimas and Enceladus in 1789, and Hyperion was observed for the first time, almost simultaneously by Bond and Lassell in September, 1848. The most distant, Phœbe, which was first seen in 1898 (photographically by W. H. Pickering), moves in its orbit in retrograde direction like the two exterior satellites of Jupiter VIII. and IX. Themis, which is called the tenth satellite, though it appears not to be the farthest from Saturn, has been observed once only since its discovery in 1900, and its reality is doubtful.

URANUS.

Discovered by William Herschel at Bath in 1781, this planet is only just visible to the naked eye. In a telescope Uranus may be distinguished from the stars around by his disc, which is obvious though less than 4″ in diameter, and by the quality of his light, which is less piercing than that of the stars. The two outer and brighter of its four satellites were discovered by Wm. Herschel in 1787; the two inner by Lassell in 1851. All four move in a plane which is almost at right angles to the ecliptic and their motion is considered to be retrograde.

NEPTUNE.

This planet, placed on the confines of the Solar system, is a small telescopic object of about the 8th magnitude. The motion of its single satellite, which was discovered by Lassell in 1846, is retrograde.

THE MOON.

Neither Mercury nor Venus, so far as is known, has a satellite; the one satellite of the Earth is the Moon, which is quite familiar to us. The mean distance of the Moon from the Earth is about 239,000 miles—near enough for us to get a more complete knowledge of its surface conditions than we can of any other member of the Solar system. Only one side of the Moon is seen from the earth, but every region of the Moon is presented to the Sun in turn and as there is no sign of water or vapour on the disc, and consequently no atmosphere, the surface must be exposed to the most violent changes of temperature: in the lunar day of half a month it must be heated to a very high temperature, and in the other half subjected to cold equal to that of interstellar space. Her diameter is rather more than 2,160 miles, and her rate of motion through the firmament $13^\circ\ 10'\ 35''$ per day, which implies that she travels over a space slightly exceeding her own diameter in one hour. The average time she takes to move around the sky is 27*d.* 7*h.* 43*m.* 11·5*s.*, and the average time from a New Moon to the next is 29*d.* 12*h.* 44*m.* 3*s.* When seen through a telescope the surface of the Moon presents many objects of great beauty and interest. A small instrument will show the chief "seas," plains, mountain ranges, ring-plains, and crater-pits.

Attempts have been made to interpret some small variations in certain of the lunar features as seasonal changes due to the change of temperature of the Moon, but observations made during lunar eclipse, when presumably the Moon suffers considerable change of temperature, gives no support to this view.

When the Earth passes between the Sun and Moon, the Earth's shadow sweeps across the Moon and causes a lunar eclipse, which may be either total or partial as in the case of solar eclipses, but there is the difference that the phase for lunar eclipse is the same for all observers where the Moon is above the horizon at the time. The obscuration of the Moon's disc is hardly ever complete, but because the Sun's light is scattered by the clouds in the Earth's atmosphere, the Moon appears usually as a copper-coloured disc, the precise shade being different at different eclipses. It will be understood that solar eclipses can take place only at New Moon, and lunar eclipses only at Full Moon.

In a note on page 36 it is explained why the Full Moon, near the time of the Autumnal Equinox, rises at nearly the same time, about sunset, on several consecutive evenings. Because in earlier times it was thought that this was specially ordained to facilitate the ingathering of the crops the phenomenon was called the Harvest Moon. The Full Moon which follows is called the Hunter's Moon.

A FEW OF THE CHIEF LUNAR FORMATIONS.

Wedge-shaped Valley of the Alps.—Near the central line of disc, towards the north, a cleft 83 miles long and 3½-5¾ miles broad.

Apennines.—An extensive mountain range somewhat similar to terrestrial features. Visible to naked eye when projecting into the dark part of the disc. Length, 460 miles; highest summit (Huyghens) reaches 18,000 feet.

Aristarchus.—A lunar crater in N.E. quadrant. The brightest object on the Moon. This crater is visible as a luminous spot when all the surrounding region is involved in shadow.

Mare Crisium.—A dark grey oval plain visible to naked eye near W.N.W. limb of Moon. Extends 280 miles N. to S. and 354 miles E. to W. Well seen five days after new or a few days after full.

Mare Serenitatis.—Lies S. of the Moon's centre, and extends over 428 miles. A nearly circular dark plain. Contains a crater, Linne, formerly suspected of change. This *mare* is visible to naked eye.

Clavius.—One of the finest craters on the Moon, and about 142 miles in diameter. Situated on S. limb.

Tycho.—Towards S. limb. Has been called "the metropolitan crater of the Moon." A fine crater 54 miles in diameter and 16,600 feet deep. Central hill nearly a mile high. Tycho is the centre of a remarkable system of bright rays radiating from it, and they are very conspicuous at the time of full moon. In its region (S. limb) the Moon's surface is so studded with craters that it resembles an immense honeycomb.

COMETS.

In addition to the planets, there are other interesting objects belonging to the Solar system, called comets. Some of these revolve in elliptical orbits, and return at intervals, which, in the case of those that have been observed, range from 3⅓ to nearly 80 years, whilst a few other computed orbits show periods as large as a million years. Other comets move in parabolic courses and apparently do not repeat their visits to the Sun.

Comets revolving around the Sun in comparatively limited times are not very numerous, but our knowledge of them is constantly becoming more comprehensive and accurate. These small returning comets revolve in periods from 3⅓ to 9 years, and deserve special notice, as their orbits are well known and predictions of their reappearances can be accurately made in many cases.

Their paths extend outwards to the position where Jupiter performs his revolution, and from this circumstance they are termed Jovian comets.

The comets in the following list (except Schorr) have already been seen at least once since discovery. The approximate time of next perihelion passage, calculated from that of their last appearance, is given in the second column:—

Borrelly	„ Nov.	1918	6·91

The dates of perihelion passage of the following comets, which are said to be periodic, but (except Tempel's) have not been seen to return, may fall about this time:—Tempel (1867), 6 yrs.; E. Swift (1894), 5·9 yrs.; Swift (1889), 8·5 yrs.; Barnard (1892), 6·3 yrs.; Swift (1895), 7·2 yrs.; Denning (1881), 8·6 yrs.; Brooks (1886), 5·6 yrs. Tempel's comet was last seen in 1879.

It is noteworthy that only one comet was discovered in the year 1923 (up to November). There are usually five or six.

There are other families of comets, none so large as the Jovian, named respectively from the planets Saturn, Uranus and Neptune, for reasons similar to that given above. Halley's comet belongs to the Neptunian family.

The most probable date for the return of Di Vico's comet of 1846 was November 1921, but the period is uncertain by 2 or 3 years. It is therefore possible that it may re-appear in 1924.

In the life of a comet the tail sometimes appears to undergo very rapid and curious changes. From examination of the spectrum of the head, comets appear to consist of carbon in various forms, and cyanogen has also been detected. Secondly, there are bright metallic lines due to sodium, magnesium and iron which appear only when the comet is near perihelion, and in some cases have become very strong upon close approach to the Sun. The spectrum of the tail shows certain characteristic bands that are due to carbon monoxide of very low density. Generally a continuous spectrum is shown as a background to the bright lines, from which we infer that a part of the comet's light is due to reflected sunlight. Comets' tails are generally directed away from the Sun, as if acted upon by some repulsive action—perhaps light.

METEORS.

Another class of objects which belong to the Solar system are the meteoric streams, giving rise to occasional showers of meteors, falling stars, or fire-balls, which are all the same class of object, the distinction being only one of size. They are visible in varying number on every night of the year, and are sometimes so abundant as to form striking phenomena. The year 1916 was notable because of a remarkably abundant and previously unknown stream on

June 28, which had a distinct connexion with Pons-Winnecke's periodical comet, the orbits being nearly the same. This comet returned to perihelion on June 12, 1921, but the attraction of Jupiter had so disturbed the comet's orbit that it passed outside the earth's path by about two million miles, and the expectation of a brilliant meteoric shower was not realized. Meteorites are composed of terrestrial elements, iron, chromium, magnesium, and nickel being in large proportion.

THE ZODIACAL LIGHT.

This is an appearance which is little understood, and therefore deserves the attention of observers. It shows as a band of faint light which stretches up slantingly from the Sun before sunrise in the autumn months and after sunset in Spring. It may be the manifestation of a widely scattered appendage of the Sun or a vast concourse of slightly reflective meteoric systems. It has been asserted that it is a mere atmospheric effect, but this is not consistent with some of the chief features of its appearance. That it has a celestial origin seems certain, but its true nature is not clearly distinguishable on the evidence before us.

THE AURORA BOREALIS.

This phenomenon may be considered more terrestrial than celestial. It sometimes happens that an unusual luminosity is seen in the northern sky in the form of streamers, arches, and condensations, a feature being the prominent bright line in the green in its spectrum which is identified with a faint yellow-green line to be observed in the background of the sky on nights when no auroral display is visible. Its chief manifestations recur at fairly regular intervals of about eleven years, and seem to be associated with magnetic disturbances and Sun-spots, which have similar periods. The aurora is sometimes regarded as showing the outer limit of our atmosphere, and its height has been determined. The general result is that the elevation of an aurora is between 50 and 200 miles. The great majority are about 60 miles high, and there are few above 100 miles. There is some suggestion that, with magnetic storms, the period of their appearance follows that of the Sun's synodic rotation (27¼ days). On March 22, 1920, there was a very extended group of spots at the middle of the Sun's disc, a magnetic storm, and splendid display of aurora during the night. A similar coincidence occurred in 1921 (May 14).

When the above numbers are less than 0·500 the planet is *horned*, when greater than 0·500 it is *gibbous* until unity is reached, when it is full.

Stellar Magnitude.—The numerical magnitude of a star shows its order in a scale of brightness, the terms of which are in geometrical progression. Stars just visible to the naked eye are of magnitude 6. A 5th mag. is about 2½ times as bright as a 6th, a 4th magnitude the same multiple of a 5th, and so on, and from this it follows that a 1st magnitude star is a hundred times as bright as a 6th. The scheme may appear paradoxical because the brightness of the fainter stars is shown by the larger numbers, but this is quite reasonable since the word "first" implies pre-eminence. It follows logically that a star 2½ times as bright as a 1st should be of magnitude 0, and a star 2½ times as bright as zero of negative magnitude, *i.e.* −1 and so on. The use of fractional magnitudes corresponding to brightnesses interpolated between these integral multiples at once suggests itself. Capella and Vega, which are nearly but not quite 2½ times as bright as a star magnitude 1·0, are mag. 0·2 and 0·1 respectively (zero magnitude). The brightness of the planets is shown in these pages according to this system.

Duration of Light and Darkness.—The second column of the first page of Calendar for every month contains a small diagram showing the amount of Darkness, or the period of moonlight and sunlight during the twelve hours from 18*h*. to 6*h*. These small diagrams have four divisions, each representing three hours, and a division is left unblacked if the moon or the sun is above the horizon for at least half of the period it represents. The diagrams for the greater part of the year are  one of each pair being used according as it is light or dark during the periods named. In the summer, when the sun is above the horizon for more than half the first and last intervals, these reduce to .

* For more complete descriptions of these signals reference may be made to the Admiralty List of Wireless Signals, 1923. *This list is subject to alterations made after date of that publication.*

When signals are sent twice in the day as indicated in the third column, or when the description applies to more than one place, the times in this column are to be read, *mutatis mutandis.*

† Signals A consist of (1) a series of dashes (—) from 10h. 44m. 0s. to about 10h. 44m. 55s. with a (.) at 10h. 45m. 0s. (first Time signal). (2) and (3) Similar series of (— . .) and (— . . . .) from 10h. 46m. 0s. and 10h. 48m. 0s. respectively, with dots for time signals at 10h. 47m. 0s. and 10h. 49m. 0s., the beginning of the dot (about ¼ sec.) being the time.

Signals B are in accordance with the resolution of the International Time Conference of 1912 and consist of a series of the letter x (Morse — . . —) from 9h. 27m. 0s. to 9h. 27m. 50s. followed by letter O (— — —) ending 9h. 28m. 0s. (preparatory signals); a series of the letter N (— .) the dot being made at every tenth second of the minute 9h., followed by O ending 9h. 29m. 0s. and a series of letter G (— — .) ending with O at 9h. 30m. 0s. The end of the third dash of the O gives the time. In other cases when the signal is a Dash, the beginning gives the time.

† 1752 same as 1772 from Jan. 1 to Sept. 2. From Sept. 14 to Dec. 31 same as 1780 (Sept. 3-13 were omitted).

THE shape of our Earth is that of an oblate spheroid, or a solid of revolution whose meridian sections are ellipses not differing much from circles, whilst the sections at right angles to these are circles. The length of the Polar axis, according to a recently accepted determination (Hayford) is 7,900·0 miles and the diameter of the Equatorial circle 7,926·7 miles. The suggestion has been made that the Equator is not an exact circle, but the supposed deviation from circularity was small, and the fact has not been proved. The mean density of the Earth is 5·5 times that of water. The Earth moves round the Sun in a plane which passes through the Sun's centre, or, to write with more precision, the centre of gravity of the Earth and Moon moves in this plane, and the Earth revolves round this centre not remaining precisely in the plane. The plane is called the plane of the Ecliptic. The Earth's Equator is inclined to this plane at an angle of 23½°, and because of this inclination the Sun is high in the sky in the Summer months and low in the Winter. It is this tilt which causes the seasons, for not only does the high altitude in Summer cause the days to be longer, but the Sun's rays fall more directly on the Earth's surface and make it hotter. The periods of Summer and Winter are opposed in the two hemispheres, the time of Summer in the Northern coinciding with Winter in the Southern, and *vice versâ*. The dates when the Sun is in the line of intersection of the planes of the Equator and Ecliptic are called the Equinoxes, and on these dates day and night are of equal duration all over the globe. The Sun and Earth are surrounded on all sides by the stars, and because the Earth moves round the Sun, the latter changes its position with respect to the stars during the year, and different sets of stars are seen in the sky at midnight in Summer and Winter. The average velocity of the Earth in its orbit is 18½ miles a second, and it moves more slowly in July than in January. It makes a complete rotation on its axis in about 23 hours 56 minutes of mean time. Because the Earth moves round the Sun in the same direction as it rotates on its axis, the length of a solar day is more than the length of a rotation by about four minutes (*see* p. 77). It has been shown almost conclusively in recent years that the axis of rotation is not a fixed line in the Earth, but that its extremity, or the North Pole of the Earth, moves in a curve, roughly spiral, about the pole of figure as centre at a distance of a few feet from it.

THE TIDES.

The Tides of the Ocean are rightly attributed to the attractive influence of the Moon on the Oceans, modified by a similar influence of the Sun, which is less in amount because of the much greater distance of the attracting body. If the Earth were a globe uniformly covered with water it would be possible to account for the observed phenomena and predict them by simple mathematical consideration of these attractive influences, but these are very greatly modified by the land formations of our globe, and the prediction of the tides for any port depends mainly on the results of observation. A series of observed times and heights of the tide having been compiled and analysed, the analysis will show that the complete tidal movement can be represented by the combination of a series of periodic terms, and when these terms are each carried forward to some future date their recombination gives the predicted tide. The mean level of the sea remains practically constant, but small changes have been detected which may be assigned to various causes. Taking the mean sea-level as datum, high water is at its highest (springs) at or near New and Full Moon, whilst low water falls an equal amount below at those times. At or near the time of the first and last quarters of the Moon (neaps) the high water rises only about half as much above the mean level as it does at springs, and the low water falls about half as little below it. These phenomena do not usually coincide exactly with the times of these phases of the Moon, but occur later, the interval being known as the *age* of the tide—thus, at London Bridge, the highest or spring tide occurs 2½ days after New or Full Moon, and the neap tide is similarly delayed. The difference of height of spring and neap tides is the most apparent of the periodic differences which make up the whole tidal variation. Besides this there are differences due to the varying distance of the Moon from the Earth, and when the Moon is at or near perigee at New or Full the tide is specially high. There is a slight difference in the heights of the spring tide at New and Full Moon, and also in the height of the neap tide at the respective quarters, but these and other small periodicities are not appreciably noticeable at some ports.

TERRESTRIAL MAGNETISM.

A phenomenon of the Earth, the origin of which is obscure, but on which some light has been thrown by recent investigations, is known as Earth magnetism. Its best known manifestation is its effect on the needle of a mariner's compass, which, except for the variations to be immediately described, points continually northward. The north point indicated by a compass needle is not, except in particular cases, the north point shown by astronomical observations; in other words, the needle does not point to the North Pole of the axis of rotation of the Earth, but makes an angle with the terrestrial meridian. This angle is called the Magnetic Variation, or, more generally, Magnetic Declination, and differs in different parts of the world and even over limited tracts of country. Along a line from the north of Norfolk through Greenwich to Chichester the declination is the same as at Greenwich. Along a parallel line through Dover the West declination is at present about a degree less; from Newcastle to Plymouth it is about 1½° greater; whilst at Dublin the declination West is 3° or 4° greater than at Greenwich. Observations of magnetic declination are made and charted to show the amount of this magnetic element over our globe, and from such charts it appears that there are two points or regions which may be considered as directive centres, and are known as the Magnetic Poles. At these places a freely suspended magnetised needle would stand vertically. They do not coincide with the terrestrial Poles, nor are they exactly antipodal. The position of the North Magnetic Pole is about latitude 73°, longitude 100° W.; the South is in latitude 72°, longitude 150° E., but these positions apparently undergo secular change. The magnetic declination at any place changes gradually year by year, and its amount observed in or near London at certain epochs is given in the table on p. 76. That the compass needle does not in general point true north and south, but that it is inclined a certain amount east or west, and that the amount varies with the locality was recognised among western nations by the end of the 15th century, Columbus being credited with the discovery. That there is a secular change in the magnetic declination, or that the amount at any place changes slowly year by year, was discovered by Gellibrand in 1634.

Magnetic Declination at London.

Year.	°	′	
1580	11	15	East.
1665	1	30	West.
1765	20	0	West.
1800	24	0	West.

In 1819 the westerly declination at Greenwich was about 24° 25′, which was probably its maximum. The needle has been since moving slowly eastward. The following table of mean magnetic elements is derived from the observations made at Greenwich in the respective years, and applies to Greenwich only. The figures for 1921, 1922 and 1923 are provisional.

Year.	Mean Magnetic Declination at Greenwich West.	Horizontal Magnetic Force in C. G. S. Units at Greenwich.	Mean Inclination or Dip of Needle at Greenwich.
	° ′		° ′
1900	16 29·0	·1846	67 8·5
1910	15 41·2	·1855	66 52·6
1917	14 37·0	·18477	66 52·0
1919	14 18·2	·18454	66 53·3
1920	14 8·6	·18454	66 53·6
1921	13 57·6	·18449	66 52·0
1922	13 46·6	·18449	66 51·9
1923	13 35·6	·18449	66 51·5

The dip is the angle that a delicately poised needle constrained to move in a vertical plane under the action of magnetism only will make with the horizontal plane.

The declination varies during the 24 hours, for the needle makes a small excursion in the morning from East to West, and returns, the range at Greenwich being about 12′ in summer and 7′ in winter. The needle occupies its mean position in the morning about 10*h*., and again about 18*h*., throughout the year. It reaches its most westerly position about 14*h*., and its most easterly position during the night or early morning according to season of the year. The inclination or dip also varies in a similar manner to the declination. Since these variations of the magnetic elements are mainly confined to the hours of daylight, are much greater in summer than in winter, and are evidently affected by changes in the solar activity—for the variation is larger at times of Sun-spot maximum than at minimum—it may be concluded that they are dependent on solar radiation and on the ionisation of the upper atmosphere by the Sun, which causes it to be highly conducting.

MAGNETIC STORMS.

Besides these diurnal movements and their periodic variations, the magnets recording the three elements sometimes make sudden and violent oscillations which may continue for several hours. Such an occurrence is known as a Magnetic Storm, and is accompanied by spontaneous electric earth-currents, which may, if violent, interfere with telegraph working. These storms generally occur when there is a large spot on the Sun, but there was a magnetic disturbance on March 24, 1923, apparently one of a series at intervals of 27 days (approx.), such as often occur when no solar outburst was visible. It is suggested that this was associated with a region of the Sun that had been previously active (Cortie, *Brit. Assoc.*, 1923).

GRAVITY.

It is deduced as a consequence of Newton's laws that two bodies exert on one another an attraction directly proportional to their masses and in inverse ratio to the square of the distance between them, and since this is so the terrestrial mass exerts an attraction upon all the bodies at its surface. The combination of this attraction with the (so-called) centrifugal force due to the rotation of the earth produces a resultant force which is known as gravity. The direction of this force is the vertical.

It is found by experiment that the force of gravity (generally indicated by the letter g) is different in different latitudes. At the Pole the force exceeds that at the Equator by rather more than a two-hundredth part, or, in other words, a person who weighs 200 lbs. at the Equator by a spring balance would weigh by the same balance 201 lbs. at the Pole.

The experiments consist in finding the time of oscillation of the same pendulum in different latitudes, the time being smaller as g is larger. A pendulum which makes a swing in exactly one second is longer at places where g is large.

The following table gives the relative values of the force of gravity and the length of the seconds pendulum at various places—g is the acceleration due to gravity in centimetre-seconds, l is given in centimetres.

EARTHQUAKES.

Earthquakes, or earth tremors, are believed to be due to some form of fracture caused by the breakage of the Earth's substance under a growing strain, when the strain has passed the breaking point. This gives rise to waves which are propagated through the solid substance to distant parts of the Earth, and vertically upwards to the surface, sometimes with disastrous effects. The point where the fracture occurs and the earthquake originates is called the seismic centre, or origin, or focus. That part of the Earth which is vertically above this centre is called the epicentre. The waves transmitted through the Earth may come to the surface hundreds, or even thousands, of miles from the epicentre, and the times of arrival are recorded. The first indications on the seismograph are made by longitudinal waves (P), which are followed after an interval by direct transverse waves (S) in approximately the same path, but which travel at a different rate. From the length of the interval of time between the arrival of the (P) and the (S) waves, the distance of the epicentre from the recording station may be inferred, and from three or more such distances it is possible to make an estimate of the position of the epicentre on the earth's surface. There is no very certain method for determining the depth of the focus, but judging from particular cases for which estimates have been made, this may range from 50 to 450 km. A violent earthquake in Japan on Sept. 1, 1923, was, with others, recorded in England.

Greenwich Mean Time.

APART from abstract and philosophical considerations, Time, in actual practice, is measured by the rotation of the Earth, and a solar day is the duration of a complete rotation of our sphere round its axis with respect to the Sun, which is rather longer than a rotation with respect to the stars. The speed of the Earth's rotation is itself uniform, but the length of the solar day is affected, first by the movement of the Earth in its orbit round the Sun, which is not constant because of the ellipticity of the orbit, and also by the circumstance that the axis about which the Earth rotates is not perpendicular to the plane of its orbit. Clocks are adjusted to an average or mean solar day which is of uniform length and is divided into 24 equal hours. This is the basis of Mean Solar Time. The length of the Mean Solar day is constant, but that of the apparent, or the interval from one transit of the Sun across the meridian to the next varies for the reasons above given, and it happens that the longest apparent solar day is about December 22, which is 30 seconds longer than the mean. The shortest solar day as thus defined is about September 16, and falls short of the mean by 21 or 22 seconds.

A unit and method of measurement having been established, it is necessary to choose a zero. The zero adopted is the instant when a fictitious body known as the Mean Sun, which is sometimes before, sometimes behind the real Sun in its apparent annual journey round the Earth, is on some chosen meridian. The time is called the Local Mean Time of any place through which the meridian passes. Usually some standard meridian, such as that of Greenwich, is chosen, and the time of that meridian is used throughout a whole country, and hence the expression Greenwich Mean Solar Time, or, more usually, Greenwich Mean Time arises (see Zone Standard Time p. 78).

Apparent Solar Time.

The time shown by a sundial is called Apparent Solar Time, and is affected by the two causes mentioned, which make the length of a solar day not uniform. It differs from Mean Solar Time by the Equation of Time which is given in the second column of page 2 for each month, and is to be used according to the precept in the heading.

The Astronomical Day.

For purposes of Astronomy the day begins at noon, and the hours following noon are numbered successively from 0 to 23. There is therefore no use of the letters A.M. and P.M. in astronomical tables, but January 1*d.* 22*h.* is the equivalent of January 2*d.* 10*h.* a.m. in ordinary parlance, and January 2*d.* 9*h.* in astronomy is recognised as being January 2*d.* 9*h.* p.m. of ordinary life, or 2*d.* 21*h.* according to the system used in these pages. The abbreviation G.M.T. indicates the time of a day which begins at Mean Noon, except when otherwise stated. A change in this system is shortly to be made, and in the *Nautical Almanac* for 1925 the Astronomical Day begins at midnight the hours being numbered from 0 to 23 as has been the practice in this Almanack since 1921. This is generally called Greenwich Civil Time, and is indicated by the letters G.C.T., but the *Nautical Almanac* does not make this distinction.

Sidereal Time.

A sidereal day is the duration of a complete rotation of the Earth round its axis with reference to the stars. This is of uniform length, and is divided, like the mean solar day, into 24 equal hours, which are shorter than a solar hour by about 9·83 seconds of mean time. As the sidereal day is about 4 minutes shorter than the mean solar day (*see* page 57), it begins earlier day by day by about that amount. The instant of the beginning of the sidereal day in G.M.T. is given on p. 2 of each month. In actual observatory practice time is measured, and the standard clock is regulated, by this rotation of the Earth with respect to the stars, and Mean Solar Time is derived from Sidereal Time by computation (*see* below). The error and rate of the sidereal clock are found by observing the instant it shows when certain stars, known as Clock Stars, cross the meridian or are due south, and comparison of this with the known time of transit (star's R.A.) will give the error of the sidereal clock. Comparison of the mean solar clock with the sidereal clock will show the error of the former. The same result might be arrived at directly by observing the instant by the Mean Time clock when the stars cross the meridian.

"Summer" Time.

In the spring of 1916 the Government adopted as a war-measure the principle of a scheme proposed by Mr. William Willett about the year 1907, and an Act was passed, known as the Summer Time Act (1916), the first clause of which runs: "During the prescribed period in each year in which this Act is in force the time for general purposes in Great Britain shall be one hour in advance of Greenwich Mean Time." Summer Time was therefore used in certain periods (*v.* below) in accordance with Orders in Council issued in each year. In the year 1922 a Bill was passed which ordained that Summer Time shall last from 2 o'clock in the morning of the day next following the third Saturday in April, or if that day is Easter Day, the day next following the second Saturday in April, until 2 o'clock in the morning of the day next following the third Saturday in September which took effect in 1923. Considerable public feeling was shown against the curtailment of the period so early in September, and as the Act of 1922 is an annual one it is not impossible that there may be some modification.

The hour being Greenwich Civil in each case.

The Act (1922) applies to Great Britain, Northern Ireland, the Channel Islands, and the Isle of Man. (*See* p. 78, note.)

Zone Standard Time.

In the year 1880 it was enacted by statute that the word "time," when it occurred in any legal document relating to Great Britain, was to be interpreted, unless otherwise specifically stated, as the Mean Time of the Greenwich meridian.* Other nations similarly used the time of their own capital, but since the year 1883 the system of Standard Time by Zones has been gradually accepted, and now nearly all the countries of the world use as Standard the Time of some meridian which differs from that of Greenwich by a multiple of 15°, and therefore differs from Greenwich Mean Solar Time by an integral number of hours, either fast or slow. In a few cases differences including a half hour have been adopted.

The countries in which Standard Time has been adopted according to this scheme are given in the accompanying table. In the United States and Canada five different standard times are used, these large territories being divided into zones approximately 7½° on either side of five central meridians. This arrangement is not strictly adhered to, because towns and cities near the dividing lines adopt which of the two times is the more suitable to railway or local requirements. The same plan is followed in Brazil, which is divided into three zones, and in these the time, 3 hours, 4 hours, or 5 hours slow on Greenwich, is adopted as standard respectively.

In the Tonga or Friendly Islands the time 11h. 40m. slow on Greenwich is used. The time of Aden 2h. 59m. 54s. fast on Greenwich is standard in Aden and British Somaliland.

The time 2 hours fast on Greenwich is called East-European, that 1 hour fast is called Mid-European. The time appropriate to Eastern Canada, 4 hours slow on Greenwich, has been called alternatively Maritime, Inter-Colonial, and Atlantic Time. The standard times in use in the other four zones of the North American continent are called respectively Eastern, Central, Mountain, and Pacific Time.

THE DATE OR CALENDAR LINE.

The line where the change of date occurs as adopted by the British Admiralty is a modification of the 180th meridian, and is drawn so as to include islands of any one group on the same side of the line, or for political reasons. The line is indicated by joining up the following eight points :—

(1) Lat. 60° S., long. 180°.
(2) ,, 51½° S., long. 180°.
(3) ,, 45½° S., long. 172½° W.

* Summer Time is the "legal" time during the period in which its use is ordained. (*See* p. 77).

THE AGE OF THE EARTH.

Various estimates have been made of the Age of the Earth, but scientific investigation shows that dates for the "Creation of the World," such as the year 4004 B.C. as adopted by Archbishop Ussher from scriptural chronology, or 3760 B.C. as is said by the Jews, are quite untenable. From the assumption that the Sun's heat is sustained solely by contraction of its bulk Lord Kelvin deduced 20,000,000 years as the time during which it has existed, but this period is too short to be accepted by geologists as the age of the Earth. The discovery of radio-active substances brought a new factor into consideration, and it has been lately estimated that as *the abode of life* (Lord Rayleigh, *Brit. Assoc.*, 1921) a moderate multiple of 1,000,000,000 years is the possible and probable duration of the earth's crust.

GEOLOGICAL PERIODS.

I. Azoic ("Without Life"), containing no trace of life in any form. The duration of this period probably far exceeded that of all the remaining divisions together.

II. Eozoic ("Dawn of Life"), characterized by the first appearance of animal life.

III. Palæozoic ("Old Life") or Primary, containing traces of extinct animal life :—
  i. *Cambrian*, exemplified in Wales (Cambria), Cumberland, etc.—the earliest group which possesses a connected suite of fossils.
  ii. *Ordovician*, exemplified in North Wales and named after the ancient British tribe (Ordovices) inhabiting the region.
  iii. *Silurian*, named after the ancient British inhabitants (Silures) of S.E. Wales.
  iv. *Devonian* or *Old Red Sandstone*, from the prevalence of the system as a marine formation in Devonshire.
  v. *Carboniferous*, including *Coal Measures*, Millstone Grit and Mountain Limestone.
  vi. *Permian*, from the Russian province of *Perm*, where these strata are widespread.

IV. Mesozoic ("Middle Life") or Secondary, with intermediate forms of animal life :—
  i. *Triassic*, from the *three* (tri-) divisions of the type formation in Germany.
  ii. *Jurassic*, typically displayed in the *Jura Mountains*.
  iii. *Cretaceous*, from the *chalky* nature of its representatives where first studied.

V. Cainozoic ("New Life") or Tertiary, containing forms of existing life :—
  i. *Eocene*, the *dawn* or beginning of *new* forms of life, *i.e.*, existing species.
  ii. *Oligocene*, containing *a few* still existing species.
  iii. *Miocene*, containing a *minority* of existing species—less than 50 per cent.
  iv. *Pliocene*, the fossil remains show a *majority* of still existing species.

VI. Quaternary ("Fourth in Order") or Post-Tertiary :—
  i. *Pleistocene* or *Glacial*, the *greatest number* of the remains are those of still existing species. Period of last Great *Ice* Age.
  ii. *Recent* or *Post-Glacial*.

Definite dates cannot be assigned to most periods, but G. de Geer has shown that scarcely 9,000 years ago the site of Stockholm was beneath the ice-sheet (VI. i.). Traces of *human* life are first found in V. iv.

THE ANTIQUITY OF MAN.

Pithecanthropos erectus (Erect Ape-man).—Remains of a skull and of a thigh bone were found in 1891 and 1892 by Professor Dubois, at Trinil, Java. These are held to be remains of a creature of Pliocene times (*see* Geological Period, *ante*), about midway between the Orang-utan and Man in development.

Homo Heidelbergensis (The Heidelberg Man).—A lower jaw was discovered near Mauer, Heidelberg, in 1907. This is held to be that of a primitive man of the earliest Pliocene Period. The difficulty of assigning dates to the Heidelberg or Trinil remains is shown in the conflict of authority, as one estimate gives 140,000 years (Rutot) for the whole, and another gives 700,000 years (Sturge) for a portion only of the Pliocene Period.

The Piltdown Skull.—Discovered in 1912 at Piltdown, Sussex, and ascribed to primitive man (Eo-anthropos) of early Paleolithic times.

Neanderthal Man.—Remains of a skull and parts of a skeleton found in 1859 in the Neanderthal Ravine, near Düsseldorf, Rhenish Prussia, and others found at *Spy*, Belgium, in 1884, are held to represent the oldest known dolichocephalic (long-headed) race in Europe, living about 50,000 years before the Christian Era.

Homo Primigenius.—Discoveries of interred human remains at Combe Capelle, Dordogne, France (1909), at Brüx and Brünn, Moravia, and at Galley Hill, Northfleet, Kent (1895) are held to be those of human beings of late Paleolithic times, from 35,000 to 15,000 B.C.

STAGES OF CIVILIZATION.

The terms employed by ethnologists cover periods which reach to the more recent geological divisions of time and extend to the present day. They are periods, not of time, but of culture, and are of local application only, there being no universal synchronous sequence in all parts of the world. This may be better understood when it is remembered that while races of Europe, Asia and America had reached the Iron Age of development long before the 18th century, A.D., there were races in Oceania still in the Paleolithic (or at least Neolithic) stage at the time of Cook's voyages. Dates appended to the various stages are necessarily conjectural and they are based on parallel discoveries of remains of extinct or still existing animal life.

The Stone Age.—The ancestors of primitive man are held to have adopted the use of stones of a suitable size for defence against predatory mammals and for the slaughter of animals for food, while primitive man made such instruments more effective by sharpening them to a rough point. The earliest period is known as *Eolithic* (or Dawn of the Stone Age), and this period may have extended to 600,000 years B.C. Weapons of a later period, known as *Paleolithic* (or Old Stone Age), show gradual developments, from the chipped, leaf-shape forms, known as *Chellean* (from Chelles, Seine et Marne, France), and employed, perhaps, from 400,000 to 100,000 B.C., to later and more effective flint points, arrow-heads and spear-heads, flat on one side, known as *Mousterian* (from Le Moustier, where many such implements and other remains were found). The Mousterian period is held to have lasted until about 10,000 B.C., when *Neolithic* (or New Stone Age), weapons, polished and less crudely fashioned, were brought into use for a further period of about 5,000 years. In the Stone Age the burial of the dead was influenced by the primitive nature of the implements available for digging, the graves being only large enough to contain a body huddled together in a cramped position.

Cultivation of the Soil.—Cultivation is believed to have followed the interment of the dead about 10,000 B.C., and rendered possible the political (*polis* = city) organisation of mankind. There appears to have been a definite centre of Western Civilization at *Nippur* (and elsewhere in Mesopotamia) no later than 6,000 B.C., and in *Egypt*, under the first of the Pharaohs (Menes), about 5,000 B.C. It is not yet known if a similar degree of Eastern civilization had been reached in China, or elsewhere, during (or before) that of Mesopotamia and Egypt.

The Bronze Age.—Intercommunication of races introduced a knowledge of the malleable properties of copper, while the spread of commerce distributed tin from Saxony and Cornwall among the races of Europe and Asia. Implements of cast bronze superseded the more primitive polished stone weapons, while utensils and ornaments of the same alloy replaced those of wood or horn or bone. The designs and decorations of the Bronze Age suggest that this stage of culture was introduced into Europe from Asia, and it must therefore be dated for the East far earlier than for the West, over a period ranging from 5,000 to 2,000 B.C. The Bronze Age appears to have been marked by the cremation of human remains, in place of mere burial in a constricted position.

The Iron Age.—Implements of cast bronze were in turn superseded by those of hammered iron at varying dates—in China, Chaldaea, Assyria and Egypt about 4000 B.C.; in South-Eastern Europe about 2000 B.C., spreading over the rest of Europe from 1000 B.C. to 100 A.D., by which time the use of hammered iron was known throughout Scandinavia and in Ireland. It is possible that the Eastern civilization discarded the use of bronze and adopted that of iron even before the West had reached the Bronze Age, and while the remoter parts were still in the Palaeolithic Age. With the Iron Age was reintroduced interment of human remains, in place of Bronze Age cremation, but the bodies were laid at full length in the ground and not huddled up as in the Stone Age. The later Iron Age has developed into the *Steel Age*, and the transition from iron to steel marks a stage in the progress of civilization at least as great as that from the Bronze to the Iron Age.

EPOCHS AND CALENDARS.

Abyssinian. — The Ethiopians have a chronological system which starts from the first day of the reign of the Roman Emperor Diocletian and proceeds in cycles of 532 years, commencing at 1 again upon the completion of each cycle. Their first year began on 29th August, 284 A.D. (See also "Coptic," *post.*)

Armenian.—The Armenians marked their secession from the Greek Church by adopting it as their epoch. This corresponds to 9th July, 552 A.D.

Assyrian or Babylonian.—In the eighth century B.C. the Babylonians commenced a chronology with the era of the founder of their Empire. Their epoch corresponds to 26th February, 747 B.C.

Biblical.—The Christians of Western Europe made many calculations concerning the date of the Creation of the World, based upon the genealogical tables in the Old Testament. In the seventeenth century (1650) James Ussher, Archbishop of Armagh, published his *Annales Veteris Testamenti*, and *Ussher's Notation* was afterwards printed in marginal notes to the Authorised Version of the English Bible. Ussher's Notation placed the Creation of the World in 4004 B.C.

Christian.—The Christian year was first adopted in Italy in the sixth and was accepted by England in the eighth century. The years are distinguished by cardinal numbers before or after the Incarnation, the period being denoted by the letters B.C. (Before Christ) or, more rarely, A.C. (*Ante Christum*) and A.D. (*Annus Domini*), the conventional abbreviation A.D. signifying *Anno Domini*, "in the year of the Lord." The correlative dates of the epoch are the 4th year of the 194th Olympiad, the 753rd year from the Foundation of Rome, 3761 A.M. (Jewish Chronology), and the 4714th year of the Julian Period. The date of the Nativity of Christ does not in fact correspond with 1 A.D., but is placed in an earlier year from B.C. 4 to B.C. 9. A "Christian Era Calendar," giving the days of the week of any year in the Christian Era, was given on pp. 98–9 of the 1921 issue.

Coptic.—In the Coptic Calendar, which is used by part of the population of Egypt and Ethiopia, the year is made up of 12 months of 30 days each, followed, in general, by 5 complementary days. Every fourth year is an Intercalary or Leap-year, and in these years there are 6 complementary days. The Intercalary year of the Coptic Calendar immediately precedes the Leap-year of the Julian Calendar. The Era is that of Diocletian or the Martyrs, the origin of which is fixed at A.D. 284, August 29 (Julian date). A Coptic Calendar for the year 1640 and part of 1641 is appended :—

Year 1640.	A.D. 1923.		Year 1640.	A.D. 1924.	
Tūt	Sept.	12	Būnah	June	8
Bābah	Oct.	12	ʽAbīb	July	8
Hātur	Nov.	11	Masrī	August	7
Kīhak	Dec.	11	Complementary days	Sept.	6–10
	A.D. 1924.		Year 1641.		
Tubah	Jan.	10	Tūt	Sept.	11

Barmahāt	March	10	Hātur	Nov.	10
Barmūdah	April	9	Kīhak	Dec.	10
Bashuns	May	9			

Hindu.—In addition to the Muhammadan reckoning there are four eras used in India. The principal astronomical system was the *Kaliyu-ga Era*, which appears to have been adopted in the fourth century A.D. It began on 18 February, 3102 B.C. The chronological system of Northern India, known as the *Vikrama Samvat Era*, prevalent in Western India, began on 23 February, 57 B.C. The year 1922 A.D. is, therefore, the year 1979 of the Vikrama Era. In Southern India, the *Saka Era*, with its epoch of 3 March, A.D. 78, was probably founded by Kanishka (whose sway was widely extended), and is in general use. The year 1922 A.D. is 1844 of the Saka Era. In the Hills, the *Saptarshi Era* dates from the moment when the Saptarshi, or saints, were translated and became the stars of the Great Bear in 3076 B.C.

There are many obsolete eras in the history of the Indian Peninsula. The principal religious systems of chronology were those of the Buddhists and the Jains. The *Buddhists* reckoned from the death of Buddha in 543 B.C. (the actual date being 487 B.C.); and the epoch of the *Jains* was the death of Vardhamana, the founder of their faith, in 527 B.C.

Japanese and Chinese.—Japan in 1872 and the Chinese Republic in 1912 adopted the calendar of Western Europe.

Jewish.—The Jews hold that the world was created at the time of the Autumnal Equinox in the year 3760 B.C. or year 954 of the Julian Period, and the epoch or starting point of Jewish Chronology corresponds to October 7 B.C. 3761. Thus the year 1924 A.D. is *Annus Mundi* 5684–5 in the Jewish Calendar. A calendar for 5684–5685 is appended:—

Note.—All Jewish Sabbaths and Festivals begin the previous evening at Sunset.

Muhammadan.—The Muhammadan Epoch is based on the Hegira or Flight of Muhammad from Mecca to Medina. The first day of the Era is not the actual day of the Flight but is 16th July, 622 A.D. This Calendar is purely lunar, and the year consists of 12 months each of 29 or of 30 days, making the year either 354 or 355 days in length. It follows that the Muhammadan year begins earlier year by year, compared with the Solar Year by 10 or 11 days. The year 1924 is therefore 1342–3 of the Hegira, a calendar for which year is appended:—

Olympiads.—Greek chronology was reckoned in cycles of four years corresponding with the periodic Olympic Games held on the plain of Olympia, in Elis, once in four years; the intervening years being the first, second, &c., of the Olympiad, which received the name of the victor at the Games. The first recorded Olympiad is that of Choroebus, 776 B.C.

Persian.—The chronology of Persia, which is still followed by the Parsees of India, dates from the accession of Yazdegerd III. to the throne on 10th June, 632 A.D. The year 1924 is, therefore, 1293 of the Parsees. The New Year begins on 21st March.

Roman.—Roman historians adopted as an epoch the Foundation of Rome, which is believed to have happened in the year 753 B.C., and the ordinal number of the year in Roman reckoning followed by the letters A.U.C. (*Anno Urbis Conditæ*). The Calendar as we know it is a Roman institution, established by Romulus, who is said to have used a year of ten months of varying length. This was altered and developed (see pp. 8 and 48) into the famous Julian Calendar which by a slight alteration (see p. 82) became the Gregorian now in general use. In the Roman (Julian) Calendar the days of the month were not counted onward from the beginning, as with us, but three fixed points were taken, and the intervening days were said to be so many days *before* the next coming fixed day. These three points were (1) the Kalends, by which name the first of each month was known; (2) the Nones, (*nine* days before the Ides, the first *and* last being counted) which fell on the seventh day of the month in March, May, July, and October, and on the fifth day in each of the other months; and (3) the Ides, which fell either on the 13th or 15th, and thus divided the month nearly equally. The Latin equivalent of Dec. 31, for example, was *Pridie Kalendas Januarias*, and the day before that *ante diem tertium Kalendas.*

CHRONOLOGICAL TERMS.

The *Day, Week and Month.*—Measurements of time are based on the times taken by the earth to rotate on its axis; by the moon to revolve round the earth; and by the earth to revolve round the sun. From these which are not commensurable, certain average or mean intervals have been adopted for ordinary use. Of these the first is the *Day*, which begins at midnight and is divided into 24 hours of 60 minutes, each of 60 seconds. The hours are counted from midnight up to 12 at noon, and again from noon up to 12 at midnight, except when the *Twenty-four Hour* reckoning is employed. The 24-hour reckoning ignores A.M. and P.M., and the hours are numbered 0 to 23 from midnight to midnight.

For the *Astronomical Day see* p. 77.

The *Week* is a period of 7 days.

The *Month* in the ordinary calendar is approximately the twelfth part of a year, but the lengths of the different months vary.

The *Equinoctial or Tropical Year* is the time that the earth takes to revolve round the sun from equinox to equinox, which is 365·2422 mean days. The *Calendar Year* consists of 365 days, but every year the date of which is divisible by 4, without remainder, is *Leap Year* and consists of 366 days, except the last year of each century that is not divisible by 400 without remainder (*e.g.* the years 1800 and 1900 had only 365 days).

Old and New Style.—In the Julian Calendar, the centennial years were all leap years, and for this reason towards the close of the 16th century there was a difference of 10 days between the tropical and calendar years (*see above*). In 1582 Pope Gregory ordained that Oct. 5th should be called Oct. 15th, and that only every fourth (instead of every) end-century year should be a leap year. This change was adopted by Italy, France, Spain, and Portugal in 1582; by Prussia, the German Roman Catholic States, Switzerland, Holland, and Flanders on Jan. 1, 1583, Poland 1586, Hungary 1587, the German and Netherland Protestant States and Denmark 1700, Sweden (gradually) by the omission of eleven leap days, 1700–1740, the British Dominions (which included the then North American Colonies) in 1752, by the omission of eleven days (Sept. 3 being reckoned as Sept. 14). This "Gregorian" Calendar was adopted by Japan in 1872, China in 1912, Bulgaria in 1915, Turkey and Soviet Russia in 1917, and by Yugo-Slavia and Rumania in 1919. The *difference* between the Old and New Styles since 1900 is 13 days (11 days after 1700, 12 days after 1800 and 13 days after 1900).

New Year's Day.—The Civil year in the British Dominions (exclusive of *Scotland*) commenced with March 25, "Lady Day" or "The Feast of the Annunciation," until 1751. But on and from 1752 the civil year has commenced with Jan. 1. The Old Style reckoning is still maintained to some extent by the British Treasury, and certain dividends are payable at the Bank of England on the Old Style Quarter Days, while the "Financial Year" is still reckoned as commencing on "Old Lady Day," April 5. *Scotland* in 1600 changed New Year's Day from Mar. 25 to Jan. 1. On the Continent, Jan. 1 was adopted as the first day of the year by Venice in 1522, Germany in 1544, Spain, Portugal and the Roman Catholic Netherlands in 1556, Prussia, Denmark and Sweden in 1559, France 1564, Lorraine 1579, Protestant Netherlands 1583, Russia 1725, Tuscany 1751.

Golden Number.—In the year 432 B.C. Meton, an Athenian astronomer, found that 235 Lunations are very nearly, though not exactly, equal in duration to 19 Solar Years. This discovery was held to be of so great importance that it was ordered to be engraved in letters of gold on a marble tablet which was placed in one of the temples at Athens. The Cycle of nineteen years is called the *Metonic Lunar Cycle*, and the number indicating the position of any year in this Cycle is called the Golden Number of the Year.

Easter-Day is the first Sunday after the full moon which happens upon, or next after the 21st day of March; and if the full moon happens upon a Sunday, Easter-day is the Sunday after. This definition, which is copied from an Act of Parliament (24 Geo. II., cap. 23, p. 751) requires further explanation, and in the section of the preamble to the Act dealing with Easter it speaks of "Tables and rules for finding the times of the Full Moon on which this dependeth that have been prepared." These are the tables whose essential points are given in the early pages of the Book of Common Prayer. The Moon referred to is not the real moon of the heavens, but a hypothetical Moon on whose phases the date of Easter depends. The lunations of the "Calendar" Moon consist of thirty or twenty-nine days alternately with some modifications, and the artificial Moon is accounted to be "full" on the fourteenth day, i.e., thirteen days after the New Moon, in order to be consistent with an early Jewish practice, and the tables are arranged so that there is close agreement between the times of Full Moon of the Calendar and of the real Full Moon, but the difference, though small, sometimes, as in the year 1923, causes an apparent uncertainty. The Full Moon of the Calendar on which Easter depends is called the *Paschal Full Moon.*

A reform of the calendar that would cause Easter-day to fall on a fixed date has frequently been proposed. A Committee of the International Astronomical Union, comprising members of the Roman Church, which met at Rome in 1922, and another under the auspices of the League of Nations, at Geneva in August, 1923, to discuss this reform, but the change is still in abeyance.

Epact.—The age of the Moon at the commencement of the year, thus indicating the difference between the solar and lunar cycles.

Solar Cycle.—A period of twenty-eight years, in any corresponding year of which the days of the week recur on the same days of the month.

Julian Period.—"A period of 7980 Julian years, proposed by Joseph Scaliger in 1582 as a universal standard of comparison of chronology, consisting of the product of the number of years in the solar and lunar cycles and the cycle of the indiction (28 × 19 × 15)."—*New English Dictionary.*

Roman Indiction.—A period of fifteen years, instituted by the Emperor Constantine in A.D. 313 for fiscal purposes.

The Dominical Letter is one of the first seven letters of the alphabet, A–G, which are used in succession to denote the Sundays (Lord's Day) in a particular year. If the first day of the year is a Sunday the letter is A; if the second, B; the third, C; and so on. Leap year requires two letters, the first for Jan. 1–Feb. 29, the second from March 1–Dec. 31.

The World.*

The *Superficial Area* of the Earth is estimated to be 196,550,000 square miles, of which 55,500,000 square miles are Land and 141,050,000 square miles Water. The *Diameter* of the Earth at the Equator is 7,926½ English miles, and at the Poles 7,900 English miles. The Equatorial *Circumference* is 24,901·8 English miles, divided into 360 Degrees of Longitude, each of 69·17 English (or 60 Geographical) miles; these Degrees are measured from the Meridian of Greenwich, and numbered East and West of that point to meet in the Antipodes at the 180th Degree. Distance North and South of the Equator is marked by Parallels of Latitude, which proceed from zero (at the Equator) to 90° at the Poles.

AREA AND POPULATION.

Continent.	Area in Square Miles.	Estimated Population.
Europe	3,750,000	475,000,000
Asia	17,000,000	1,013,000,000
Africa	11,500,000	143,000,000
North America	8,000,000	146,000,000
South America	6,800,000	64,000,000
Oceania	3,450,000	8,500,000
Polar Regions	5,000,000	...
	55,500,000	1,849,500,000

The British Dominions extend over the largest area (14,220,000 sq. miles); Russia is the second largest country (8,000,000 sq. miles); France is third, with 4,336,000 sq. miles; China extends over 4,300,000 sq. miles; the United States, with its Insular Jurisdiction, &c., covers 3,750,000 sq. miles, and Brazil 3,220,000 sq. miles.

THE RACES OF MANKIND.†

The Races of Mankind are divisible according to Stock or, less scientifically, according to Colour. The Dominant Colour is Yellow—the numerical order being (1) Yellow, (2) White, (3) Black, (4) Brown, (5) Red. The main Divisions of the Races are as follows:—

Division.	Area.	Estimated Number.
Mongolian	Asia	680,000,000
Caucasian	Europe & Orient	725,000,000
Negro	Africa	210,000,000

* The Earth is a *Sphere*, with a Northern and Southern *Hemisphere*; the Ocean surface is the *Hydrosphere*, and the gaseous envelope the *Atmosphere*, of which the lower layers are the *Troposphere* and the upper the *Stratosphere*. The science concerned with the study of the Earth's crust is *Geology*, with the measurement of its surface *Geodesy*; the study of its surface is *Geography*, and of its superficial features *Physiography*. The study of the hydrosphere is *Oceanography*, of the lakes *Limnology*, and of the mountains *Orography*, of the Races of Mankind *Ethnology*, of their location *Ethnography*, of extinct organic life *Palæontology*, and of existing life *Biology*.

An airship with a constant speed of 100 miles an hour would take nearly 105 years to reach the Sun. The velocity of a given point of the Earth's surface at the Equator exceeds 1,000 miles an hour (24,901·8 miles in 24 hours); the Earth's velocity in its orbit round the Sun is about 66,600 miles an hour (584,000,000 miles in 365 days, 6 hours, 9 minutes).

† It has been estimated that the Earth can maintain a population of 6,000,000,000, a total which will be reached about A.D. 2100, at the present rate of increase.

OCEAN AREAS AND DEPTHS.

The greatest known Ocean Depth (in the Pacific, off Mindanao, 32,089 feet) is not much greater than the greatest land height (in the Himalayas); but the mean depth of the Ocean floor exceeds 12,000 feet, while the mean height of the surface of the land area of the Earth above sea level is only 2,300 feet. The following table gives the areas of the principal oceans and seas, with the greatest known depth of each:—

Name.	Area of Basin (sq. miles).	Greatest Depth (feet).

THE SEVEN WONDERS.

The *Seven Wonders of the World* are generally enumerated as follows :—

*The Pyramids.
The Hanging Gardens of Babylon.
*The Tomb of Mausolus.
*The Temple of Diana at Ephesus.
The Colossus of Rhodes.
The Statue of Jupiter by Phidias.
The Pharos (lighthouse) of Alexandria.

---

* The Pyramids may be visited from Cairo. The "Ephesus" Room at the British Museum, Bloomsbury, contains the remains of the Temple of Artemis (Diana) at Ephesus (the Temple of "Diana of the Ephesians" of Acts xix. 28); the "Mausoleum" Room at the British Museum contains the remains of the tomb built at Halicarnassus for Mausolus, in the 4th century B.C.

The League of Nations.

One of the results of the Great War was the formation of a League of Nations, with a Covenant, and a Charter of XXVI Articles.

The High Contracting Parties agreed to the Covenant in order to promote International Co-operation and to achieve International Peace and Security, by the acceptance of obligations not to resort to War

"by the prescription of open, just and honourable relations between Nations;

by the firm establishment of the understandings of International Law as the actual rule of conduct among Governments;

and by the maintenance of justice and a scrupulous regard for all Treaty Obligations in the dealings of Organized Peoples with one another."

The territorial integrity and existing political independence of all members of the League is guaranteed by Article X of the Covenant. In case of any dispute between members, likely to lead to a rupture, they will submit the matter to arbitration or enquiry, and agree not to resort to war until three months after the award by the arbitrator or the report by the Council, such award to be made within a reasonable time, and such report to be made within six months of the submission of the matter in dispute. Any member resorting to war in disregard of these rules shall be deemed to have committed an act of war against all the remaining members of the League, who undertake to subject the aggressor to the severance of all intercourse and trade or financial relations, while the Council of the League shall recommend to the Governments concerned what effective force shall be contributed by each to protect the covenants of the League.

In the event of a dispute between a member of the League and a State which is not a member (or between States that are not members) invitation shall be made to the State or States that are not members to accept membership, with its privileges and obligations. If the invitation be refused, and the State that is not a member resort to war against a member of the League, such State shall be deemed to have made war on every member of the League and shall be so dealt with. If the invitation be refused by States that are not members, the Council shall take such steps as may be possible to avert hostilities and to settle the dispute.

Article XXIII provides for securing fair and humane conditions of labour for men, women and children in the countries of members, and in those in which members have commercial and industrial relations, and provides for the just treatment of natives; for the suppression of the "White Slave" traffic; for the supervision of the traffic in opium and dangerous drugs, and in arms and ammunition; for the freedom of communications and trade between members, and for the prevention and control of disease.

The formation of the League was very largely the work of Woodrow Wilson, President of the United States of America 1913–21, but his action in committing the United States to participation in the League was repudiated by the Foreign Relations Committee of the Senate of the U.S. and was not endorsed by the electors in the Presidential Election of 1920.

The *Council of the League* consists of representatives of the British Dominions, France, Italy and Japan, together with representatives of four other members of the League selected by the Assembly of Representatives of the members of the League. Any member of the League not represented on the Council shall be invited to send a representative to sit as a member of the Council during the consideration of matters specially affecting the interests of that member of the League.

The original members of the League were the Signatories of the Treaty of Peace at Versailles on behalf of the Allies, June 28, 1919, such signatories being indicated by an asterisk (*) in the following list, but the *United States*, *Ecuador* and *The Hejaz* (whose representatives signed the Treaty) did not send delegates to Geneva.

The following Nations were represented at the *First Assembly of the League of Nations* at Geneva, Dec., 1920.

Luxemburg

Any fully self-governing State, Dominion or Colony, not named as an Original Member, may become a member of the League if its admission is agreed to by two-thirds of the Assembly.

Any member of the League may, after two years' notice of its intention to do so, withdraw from the League, provided that all its international obligations, and all its obligations under the Covenant, shall have been fulfilled at the time of its withdrawal.

In May 1923 the League had a membership of 52 States. The budget of the League estimates the expenditure for 1922 at 20,873,945 *gold francs* (at par of exchange £822,730), recoverable from the Nations in agreed proportions.

ANNUITIES TO THE ROYAL FAMILY.

The annuities payable to Their Majesties and to the members of the Royal Family are known as the *Civil List*, which is granted by Parliament upon the recommendation of a Select Committee. The Civil List of King Edward VII. amounted to £470,000, in addition to which annuities to other members of the Royal Family accounted for an additional annual sum of £106,000. The Select Committee appointed on June 14, 1910, reported on July 7, and made recommendations, which were adopted by the House of Commons. These recommendations, as modified by subsequent events, are as under:—

Their Majesties' Privy Purse	£110,000
Salaries of Household	125,800
Expenses of Household	193,000
Works	20,000
Royal Bounty	13,200
Unappropriated	8,000
	£470,000

Queen Alexandra	£70,000
Duke of York	25,000
Princess Louise (Duchess of Argyll)	6,000
Duke of Connaught	25,000
Princess Beatrice	6,000
King Edward VII.'s Daughters	18,000
His Majesty's Younger Children	13,666
	£163,666

The Peerage.

In a broad sense this heading is commonly taken as identical with that of the House of Lords, although there are close upon 130 holders of titles of long-standing nobility who are not members of the Upper House of Parliament, their peerages being those of Scotland or Ireland only. But there are about an equal number of Peers of those kingdoms who possess additional titles which constitute them members of the House of Lords, these titles being in a majority of instances, though very far from all, inferior to those by which they are generally known. The full details as to each are given under his leading title, and a reference is in every case supplied under any other that he may hold, so that the table of equivalent titles formerly given in this work is no longer needed : a double index will be found in "WHITAKER'S PEERAGE, BARONETAGE, KNIGHTAGE AND COMPANIONAGE."

Contractions.—*S.* or *I.* appended to the date of creation denotes a *Scottish* or *Irish* title ; the further addition of a * implies that the Peer in question holds also an Imperial title, which is specified (after the name) by its more definite description as *Engl.*, *Brit.*, or *U.K.* When both titles are alike, as in the case of Argyll, this star is appended to the conjoined date below, and it then denotes that such date is that of the Imperial creation. A † appended to *S.* or *I.* implies that the Peer is an elected Representative to the House of Lords. For the mark ° see heading to Marquesses ; *b.*, signifies born ; *s.*, succeeded ; *m.*, married ; *w.*, widower or widow ; *div.*, divorced ; *M.*, minor.

Women take the same rank as their husbands or as their eldest brothers; but the daughter of a Peer marrying a Commoner retains her title as Lady or Honourable. Daughters of Peers rank next immediately after the wives of their elder brothers, and before their younger brothers' wives. Daughters of Peers marrying Peers of lower degree take the same order of precedency as that of their husbands; thus the daughter of a Duke marrying a Baron degrades to the rank of Baroness only, while her sisters married to commoners retain their rank and take precedence of the Baroness. Merely official rank on the husband's part does not give any similar precedence to the wife.*

Dames Grand Cross of the British Empire rank after wives of Baronets and before wives of Knights Grand Cross, after the latter coming Dames Commanders, before the wives of Knights Commanders.

Local Precedency. — No written code of county or city order of precedence has been promulgated, but naturally in the county the Lord Lieutenant stands first, and secondly the Sheriff. In London and other Corporations, the Mayor stands first after him the Aldermen, Sheriffs, Chief Officers, and Livery. At Oxford and Cambridge the High Sheriff takes precedence of the Vice-Chancellor.

The Order was divided into *Military* and *Civil* divisions in Dec., 1918.

THE KNIGHTS BACHELOR.

The Knights Bachelor do not constitute a Royal Order, but comprise the surviving representation of the ancient State Orders of Knighthood. The Register of Knights Bachelor, instituted by James I. in the 17th century, lapsed, and in 1908 a voluntary association under the title of "The Society of Knights" (now "The Imperial Society of Knights Bachelor" by Royal command) was formed with the primary objects of continuing the various registers dating from 1257 and obtaining the uniform registration of every created Knight. An annual Knightage is published from information supplied by the authorities, and can be obtained on application. The Officers of the Society are:—*Principal*, Sir William Bull, Bt., M.P.; *Vice-Principal*, Commander Sir Trevor Dawson, Bart., R.N.; *Hon. Registrar*, Sir Park Goff M.P.; *Clerk*, Hubert Whelbourn; *Registry and Library*, The College of Arms, Queen Victoria Street, E.C. 4.

Welch Sovereigns and Princes.

WALES was ruled by Sovereign Princes from the "earliest times" until the death of Llewellyn in 1282. The first English Prince of Wales was the son of Edward I., and was born in Carnarvon town on April 25, 1284. According to a discredited legend, he was presented to the Welch chieftains as their Prince, in fulfilment of a promise that they should have a Prince who "could not speak a word of English" and should be native born. This son, who afterwards became Edward II., was created "Prince of Wales and Earl of Chester" at the famous Lincoln Parliament on February 7, 1301. The present Prince was installed in Carnarvon Castle on July 13, 1911.

Premiers, Principal Secretaries,

Premiers and Secretaries of State.—The inability of George I. to understand the English language made his attendance at meetings of the Cabinet "useless and irksome, and allowed the appearance of a Prime Minister, for his example has been so consistently followed as to have become a settled custom." In 1905 the office of Prime Minister was officially recognised. The first mention of a King's Secretary of State is under Henry I In 1433, owing to press of work in France, two Sec taries were appointed. and until 1794 two seems to ha been the normal number. From 1688 to 1782 one of t two dealt with matters pertaining to the Northern St of Europe, the other with matters pertaining to t Southern States, Home, Irish, and Colonial business.

and other Officers of State.

1782 the former became Foreign and the latter Home Secretary, still retaining Irish and Colonial business. The Home Secretary was also responsible for the Secretary at War, who, though not a Secretary of State, directed the movements, payment, and civil control of the Army. In 1794 a Secretary of State for War was appointed to manage all military business, and in 1801 he was given the control of the Colonies. In 1854 the War Secretary was relieved of Colonial business, and a fourth Secretary of State was appointed for the Colonies. In 1858 the Secretary of State for India was appointed, and in 1918 the Royal Air Force was constituted, with a Secretary of State as President of the Air Council.

SECOND SESSION, 1922

THE NEW PARLIAMENT.—In order to give immediate effect to the Constitution for the Irish Free State, the new Parliament—the first of Great Britain and Northern Ireland, though described on official documents as the thirty-second of the United Kingdom of Great Britain and Ireland—met shortly after the general election. Members assembled on *Nov.* 20, when, in the House of Commons, on the motion of Mr. T. P. O'Connor, the "Father" of the Chamber, seconded by Mr. Pretyman, Mr. J. H. Whitley was re-elected Speaker. Mr. O'Connor remarked that the House required a Speaker with some humour because it was sometimes subject to gusts of passion. Sometimes it was like a boys' school, sometimes like a girls' school; but it could always be brought back to self-control by a timely appeal to its always present sense of humour. Mr. Whitley accepted the honour and was escorted to the Chair by the Prime Minister, tributes being paid to the Speaker by Mr. Clynes and Mr. Asquith. On the following day the King's Approval of the Commons' choice was announced, and the swearing in of members commenced.

THE KING'S SPEECH.—The opening of the Session by the King took place on *Nov.* 23, when His Majesty was accompanied by the Queen, the Prince of Wales and the Duke of York. In his speech from the Throne, His Majesty said that Parliament had been summoned to deal with the legislation necessary to give effect to the Free State Constitution, and announced that the ameliorative measures prepared by the late Government on the subject of trade and employment were being examined afresh with a view to their continuance and extension. In the House of Lords Lord Erskine moved and Lord Queenborough seconded the Address in reply, which was agreed to after a debate concerned mainly with British commitments abroad. In the other Chamber the Address was moved by Capt. W. Brass and seconded by Mr. Margesson in excellent maiden speeches. The new Leader of the Opposition, Mr. Ramsay MacDonald, in a speech that created a good impression, declared the reference to employment in the King's Speech to be "profoundly unsatisfactory," and said that the Labour Party were there to give constitutional force and political expression to the needs and desires of the workers. Mr. Bonar Law said the Government wished the Irish Treaty success in the interests both of Ireland and of Great Britain, while Mr. Asquith expressed the strongest hope and confidence that the genius and national sense of the Irish people would carry them through their present and future troubles. An amendment moved by Mr. Clynes regretting the absence of any indication of a change in the Coalition Government's foreign policy with a view to improving trade and decreasing unemployment was defeated by 303 to 172 on *Dec.* 1; one moved by Sir John Simon demanding the repeal of the Safeguarding of Industries Act was rejected by 269 to 207 on *Dec.* 4; and a third on the agricultural position, ntroduced by Sir R. Winfrey, was beaten by 67 to 52 on *Dec.* 5, when the Address was greed to.

THE IRISH BILLS.—The Prime Minister on *Nov.* 24 presented the two important Bills of the rief Session—one to provide for the Constitution of the Irish Free State and the other to make such provisions as were consequential or incidental to the establishment of the Irish Free State, mainly affecting Northern Ireland. Moving the second reading of the former Bill on *Nov.* 27, Mr. Bonar Law said that the Treaty had already been ratified by the Southern Irish Parliament, and the Imperial Parliament could make no change unless it were subsequently agreed to in the Southern Irish Parliament. The question was whether the Constitution complied with the Treaty or not. The Law Officers of the late Government and the Lord Chief Justice declared that the Constitution was in accordance with the Treaty, and the Prime Minister recommended the Bill without any special fear as to the result and without any exaggerated expression of hope. Mr. Ramsay MacDonald shared the hope that the agreement would bring about that spirit of happiness and co-operation between the two countries which all past efforts in governing Ireland had failed to achieve. The rejection of the Bill was moved by Mr. Saklatvala and seconded by Mr. Newbold, but the motion was negatived and the second reading agreed to without a division. The Committee stage was passed on *Nov.* 28, and on the following day the two Bills received their third reading. The House of Lords quickly passed both measures and on *Dec.* 5 the Royal Assent was given. When Parliament was prorogued on *Dec.* 13 the King's Speech contained the passage: "It is my earnest prayer that the passing of these measures will mark the inauguration of a period of prosperity and concord for both Ireland and Great Britain."

THE CATTLE EMBARGO.—As a result of the resolution passed by both Houses in the preceding Session, in favour of the removal of the embargo on Canadian cattle, Sir Robert Sanders on *Dec.* 4 presented a Bill to amend the existing law. Moving the second reading on *Dec.* 7, the Minister of Agriculture said under the agreement with representatives of the Canadian Government, Canadian store cattle were to be admitted into this country provided they were shipped direct from a Canadian port to a port in Great Britain; that they were kept under veterinary observation for three days immediately before embarkation; that during the voyage they were thoroughly examined by a veterinary officer of the Dominion; and that they were landed at specified landing places in this country and examined by port officers. The Bill, which also applied to Irish cattle, carried out these conclusions. An amendment for its rejection was defeated by 379 to 27 and the second reading was secured. The subsequent stages in both Houses were reached with little debate, though Lord Carson attempted to remove Northern Ireland from the scope of the measure, and the Royal Assent was given on *Dec.* 15.

HELP FOR AUSTRIA.—Among the objects of the Trade Facilities and Loans Guarantee Bill, which was passed during the Session, was the provision of help for Austria. Moving the second reading on *Dec.* 6, Mr. Stanley Baldwin said it was hoped that each of the three parts would assist and improve the trade of the country. The first part continued for another year the Trade Facilities Act of 1921, placing at the Government's disposal for that second period a sum of £25,000,000 to be devoted to the aid of industries by guaranteeing loans made for the purpose of bringing orders into this country. The second clause provided a guarantee by the Government of a market loan to be raised in order to aid in the stabilization of the Austrian currency and the renaissance of Austrian finance, Britain's share being about £6,500,000. The remaining part guaranteed a loan to the Soudan Government for irrigation works.

SESSION, 1923

THE KING'S SPEECH.—The normal session was inaugurated with full state on *Feb.* 13 by the King, who was accompanied by the Queen, the Prince of Wales and the Duke of York. In His Majesty's speech from the Throne reference was made to the situation in the Ruhr, the Lausanne Conference, and the prospective settlement of Great Britain's war debt to the United States, and legislation was promised dealing with housing, unemployment insurance benefit, trade boards, industrial assurance, legal reforms and the granting of credit facilities to agriculturists. In the Upper Chamber Lord Willoughby de Broke moved and Lord Hastings seconded the Address, and replying to Viscount Grey Marquis Curzon said that the attitude of the British Government in regard to the Ruhr was one of benevolent neutrality. He indicated his readiness to welcome action by the United States. The Address was agreed to. Mr. Samuel Roberts moved and Mr. Collingwood Hughes seconded the Address in the Commons, and in the course of the debate Mr. Asquith urged that Great Britain should press both on France and Germany the necessity of allowing the question of reparations to be dealt with by the League of Nations, a suggestion which the Prime Minister did not consider practicable at the time. An amendment moved by Mr. Clynes regretting the absence of any indication of a policy to check "the progressive economic ruin of Europe" was defeated by 277 to 180 on *Feb.* 16, and three days later an amendment framed by the two wings of the Liberal Party urging the appointment by the Council of the League of Nations of a commission of experts to report upon Germany's capacity to pay reparations and the best method of payment was rejected by 305 to 196. The Address was agreed to on *Feb.* 20 after the defeat by 273 to 167 of an amendment counselling immediate and drastic curtailment of expenditure in Mesopotamia and by 307 to 176 of a Labour amendment regarding war pensions.

THE NEW PREMIER.—After a fruitless holiday in search of health, Mr. Bonar Law resigned on Whit Sunday, and a few days later Mr. Stanley Baldwin agreed to form an Administration, the majority of the old Ministers being reappointed. The new Prime Minister was chosen as Leader of the Conservative Party on *May* 28, and on the same day, when Parliament resumed after the short Whitsuntide recess, warm tributes were paid to Mr. Bonar Law in the House of Commons. Mr. MacDonald expressed the profound regret of all parties at Mr. Bonar Law's withdrawal, and with regard to his successor declared amid laughter that he would do his best to "frustrate his politics" and to "confound his knavish tricks." Mr. Asquith and Mr. Lloyd George happily expressed their sympathy and their good wishes. Mr. Baldwin returned thanks in a few felicitous phrases, and Mr. Austen Chamberlain followed with generous appreciation of the old Premier and the new.

THE BUDGET.—In a speech that went far towards ensuring his succession to the Premiership little more than a month later, Mr. Stanley Baldwin set out his Budget proposals on *April* 16 and secured warm approval for a policy which placed debt redemption first coupled with a number of welcome reductions in taxation. The Chancellor announced that the revenue for the past year had been £914,000,000 and the expenditure £812,500,000 the surplus of £101,500,000 (due to reduction of expenditure) having automatically gone to the reduction of debt. He proposed to include in the Finance Bill a clause providing a sinking fund of £40,000,000 this year with five millions more in the following year and a similar addition a year later. With regard to the current year he estimated the total expenditure as £816,616,000, while on the basis of existing taxation, he placed the revenue at £852,650,000, a surplus of about £36,000,000. After remarking that the proposal to put a tax on betting would be considered by a Select Committee, Mr. Baldwin came to his reductions in taxation. The rates for heavier letters and for inland parcels and the annual rentals for telephones would be reduced; a rebate of £1 per bulk barrel would be given on beer, except on beer of low gravity; the duty of 4*d.* per gallon on cider and perry would be repealed and that on table waters reduced to 2*d.* a gallon; the income tax would be reduced by 6*d.* to 4*s.* 6*d.* in the pound; and the corporation tax would be reduced from 1*s.* to 6*d.* in the pound in respect of profits arising after *June* 30, 1923. These reductions he estimated would cost £34,150,000, leaving a revenue of £818,500,000 and a surplus of £1,884,000, to be kept for contingencies. In conclusion the Chancellor expressed the belief that the country had already passed the peak load of taxation and that they might hope soon to have relief from the calamitous years of trade depression. Mr. Ramsay MacDonald congratulated Mr. Baldwin upon his debt reduction proposals but suggested that the money off the income tax went into luxuries and urged a reduction in the sugar duty. The resolutions were passed after several sittings, and on *April* 23 the Finance Bill was read a first time. The second reading was secured on *May* 14, after the defeat by 271 to 157 of an amendment for the rejection of the Bill, moved by Mr. Philip Snowden, on the ground that it made no adequate provision for the reduction of the National Debt and no reduction of the heavy duties on the necessities of life. On Committee, the Government accepted a suggestion that the possibility of passing on the reduction in the mineral water duties to the consumer should be considered, and concessions were made regarding the new assessment of houses. The sections of the Act of 1910 providing for the registration of particulars of land and property values in every transfer of land and property were repealed. During the Report Stage a new clause was agreed to freeing from the Entertainments Tax entertainments promoting the interest of any industry or art and agricultural and trade shows. The Bill was read a third time on *July* 4 by 249 to 145 after the Prime Minister had reviewed the negotiations for the funding of the American Debt. The terms were fair and honest, Mr. Baldwin declared. He believed that they laid the foundation of the constructive settlement of the world problem. Dealing with the question of Allied debts, he said that those who owed us money owed us money still; we were the creditors and they were the debtors. The Bill passed speedily through the House of Lords and the Royal Assent was given on *July* 18.

THE IRISH DEPORTATIONS.—As a sequel to the deportation to Ireland from Great Britain of over a hundred persons under the Restoration of Order in Ireland Regulations, and the resulting proceedings in the High Court, a Bill was presented by Mr. Baldwin on *May* 17, to prohibit the institution of legal proceedings against the Home Secretary in respect of his action. In moving the second reading on *May* 28, Mr. Baldwin—by that time Prime Minister—announced that while all legal claim to compensation would be barred by the Bill, the Government had decided to receive claims in respect of actual expenses or direct loss suffered by any of the deportees in consequence of their arrest and deportation to Ireland. Disputed claims would be referred to some impartial person of judicial experience for adjustment. He added that the Government had decided to set up a small expert committee with a judicial chairman to consider the regulations made under the Restoration of Order in Ireland Act, 1920, and advise as to the amendment or cancellation of any such regulations. A motion for the rejection of the Bill was defeated by 297 to 143, and the second reading was carried. During the Committe stage on *May* 29, Lord Robert Cecil agreed that the Bill went beyond the indemnity of the Home Secretary, and he subsequently brought forward a clause limiting the scope of the Bill to acts done under Regulation 14B, which was agreed to. On report on *June* 1 an amendment was added limiting the Bill to occurrences since *Dec.* 6, 1922, and the third reading was accorded, the Royal Assent being given on *June* 7.

THE HOUSING PROBLEM.—The main work of the Session centred round the provision of housing accommodation, and after a change in policy as a result of the defeat of three Ministers at bye-elections, several Bills were passed. The first was designed to overcome the difficulty caused by the House of Lords decision in regard to the "notice to quit" provision in the Act of 1920, which had led to "rent strikes" in various parts of the country. Explaining the proposals on *Feb.* 22 Sir Douglas Hogg said that landlords would be empowered to keep any amounts in excess which had been paid before *Dec.* 1, 1922, and to recover any arrears kept back since that date, but they could not recover arrears which had not been collected on that date. A Labour motion for rejection was defeated by 288 to 196 and after being dealt with by a Standing Committee the Bill received the Royal Assent on *May* 17. A long fight took place over the Housing Bill, which was outlined on *April* 24 by Mr. Neville Chamberlain, the new Minister of Health, in moving the second reading. Describing the Bill not as the solution of the problem but as the beginning of a solution, he said he hoped to encourage private enterprise, and as a particular class of house required could not be provided by private enterprise alone he proposed to give a subsidy of £6. This was to be paid to local authorities and not to individuals, and it might be used for giving assistance to private enterprise and for providing houses by the authority itself. The Bill laid down the limits of the size of the houses to be assisted, and criticism was mainly directed to these clauses, which were modified in some respects. The Bill was read a second time on *April* 26 after the defeat by 340 to 140 of a Labour motion for rejection, and emerged from the Standing Committee with a number of minor alterations, receiving the Royal Assent on *July* 31, just before Parliament adjourned until *Nov.* 13. The closing day of the first part of the Session also saw the Royal Assent given to another important Bill, one to amend and prolong the duration of the Increase of Rent and Mortgage Interest Restrictions Act of 1920. Moving the second reading on *June* 6 Mr. Neville Chamberlain said that to attempt to make a clean cut of decontrol even in 1925 would be found to be impossible when the time came. In the Bill he contemplated a period of seven years during which control in some form or other would be continued. The existing Act was to be maintained for another two years subject to certain modifications, and it was then to be followed by a longer period during which the tenant was to be protected against the danger of eviction at the whim, or to serve the cupidity of a landlord. Under the modifications it was provided that when the landlord came into possession of his house after the passing of the Bill that House would come out of the Act. The increases of rent permitted under the existing Act were not altered, and Reference Committees were established to take some of the work from the County Courts. The rejection was moved by Mr. Sidney Webb, but on the following day this was defeated by 287 to 123 and the Bill was read a second time, the third reading being secured on *July* 13—after consideration by a Standing Committee—by 212 to 111.

RELIEF FOR AGRICULTURE.—Before Parliament rose two Bills providing relief for the agricultural industry were passed. The first, as explained by Sir Robert Sanders on *May* 30, when it was given a second reading, enabled men who had bought their farms between the date of the introduction of the Corn Production Act of 1917, and the date of its repeal in 1921, to obtain mortgages repayable by annual or half-yearly payments in interest and sinking fund up to 75 per cent. of the present value of their farms. These mortgages would be granted through approved associations which would be restricted in their profits, the Government sanctioning loans repayable in 60 years at a rate of interest and sinking fund charges which would work out at £5 10*s.* 7*d.* per cent. A scheme for the formation of co-operative credit societies, to apply to small holders and agricultural labourers as well as farmers, was embodied in the Bill. The other measure provided that occupiers of agricultural land who now paid half the rates to which the Bill applied should in future pay one quarter of those rates. The estimated deficiency would be paid into the local taxation accounts by the Exchequer. Mr. Neville Chamberlain, in moving the second reading on *June* 4, said that the Bill was only a temporary measure and he hoped shortly to bring forward permanent provisions in regard to the rating of agricultural land.

THE WAR BONUS.

In order to counteract the increase in the *Cost of Living* the Government introduced a *Bonus Scheme*, under which salaried Civil Servants and wage-earning Government employees receive temporary additions to their salary or wages. The scheme was applied, irrespective of age or sex, as from March 1, 1920, the limit of the addition in any case being £750 per annum. The Government Bonus Scheme has been adopted generally by Public Authorities, certain modifications being made in particular instances. The scheme formulated a basic rate of increase, producing a basic addition to salaries or wages, and this basic rate rises or falls 1 *twenty-sixth* in response to every *five points* rise or fall in the Index figure average of prices over a six months' period. The standard cost of living in March, 1920, was 130 per cent. in excess of that of July, 1914, and the scheme of increase agreed by the *Whitley Council* is as follows:—

> Where the ordinary rate of remuneration does not exceed 30s. per week—130 per cent. increase.
>
> Where the ordinary rate of remuneration exceeds 35s. a week, but does not exceed £200 per annum—130 per cent. on the first 35s. a week (£91 5s. per annum) and 60 per cent. on the excess over £91 5s.
>
> Where the ordinary rate of remuneration exceeds £200 per annum—130 per cent. on the first £91 5s., 60 per cent. on the next £108 15s., and 45 per cent. on the amount in excess of £200 up to £500.

The bonus additions were at their height in March, 1921, when they followed the Index figure average of 165, and the annual cost of the scheme in the Civil Service was £45,000,000. The Bonus payable from Sept. 1, 1923, represents the basic rate of 130 per cent. in excess of July, 1914, *less* eleven twenty-sixths decrease, equivalent to a fall of 55 points from the March, 1920, standard (or 90 points from March, 1921). Each twenty-sixth reduction in the Civil Service salaries and wages represents about £1,250,000 annually. In addition to the reduction caused by the automatic decline of the cost of living figure the following decreases have been introduced:—

> 10 per cent. on salaries from £500 to £700; 15 per cent. on salaries from £700 to £800; 20 per cent. on salaries from £800 to £900; and so on until 60 per cent. is reached in the case of salaries of £1,600 a year.

Details of the Bonus addition to Salaries and Wages, under the scale in force at various dates, are shown below:—

MISCELLANEOUS STATUTES.

A NOTABLE triumph was secured by a private member, Mr. Entwistle, in placing upon the Statute Book a Bill which gave to women the right of divorce on the ground of their husbands' misconduct, thus placing the sexes upon an equality in this respect. Given a second reading on *March* 2 by 231 to 27, the Bill was considered by a Standing Committee, received its third reading by 257 to 26 on *June* 8, and, passing through the Upper Chamber without amendment, was given the Royal Assent on *July* 18. Viscountess Astor was also successful with a temperance measure, her Bill to make it illegal knowingly to sell to anyone apparently under 18 any kind of intoxicant for consumption in a public house being read a second time by 338 to 56, and receiving the Royal Assent on *July* 31. Other measures passed included one giving increased powers for dealing with the illicit traffic in drugs and another enabling special constables to be recruited.

GOVERNMENT STAFFS.

FROM Sept. 1, 1922, to Aug. 31, 1923, a reduction of 10,766 was made in Government Staffs. The following are the details for Sept. 1, 1923:—

COLONIAL OFFICE, Downing Street, S.W. 1.

The business of the Colonies was, until 1801, included in the functions of the Home Secretary, to be transferred in that year to the newly-created "Secretary for War." In 1854 the outbreak of the Russian War led to the appointment of a Secretary of State for the Colonies (to relieve the War Secretary of Colonial business). The Colonial Secretary possesses an advisory power of veto on legislation of the self-governing Dominions, and is responsible for the government of the remaining Dominions beyond the Seas in inverse proportion to the amount of self-government granted to them. The salaries, &c., of the Colonial Office are estimated at £146,993 for 1922-23.

Office, Lancaster Place, Strand, W.C. 2.

Lancaster was elected into a Palatine Duchy by Edward III. for his son John of Gaunt in 1359, but in 1399 it became merged in the Crown through the accession of his son as Henry IV.

The Revenue of the Duchy of Lancaster was £29,000 in 1847 and amounted to £126,562 in the year ended December 31, 1922. The contributory items are Rents and Profits of Courts, £65,539; Royalties and Dues, £39,785. Expenditure: £15,035, Outlay for the benefit of the Estate; £32,040, deducted under various Acts of Parliament; £6,121, Allowances, Donations, and Charities; £2,000, Salary of the Chancellor of the Duchy; and £12,417, Expenses of Management. The sum of £49,000 was paid (for His Majesty's use) to the Keeper of His Majesty's Privy Purse.

THE COUNTY PALATINE OF DURHAM.

It is uncertain when "Palatine" privileges were first exercised in the County of Durham, as no formal creation of the Palatinate by charter or deed appears to have ever been made. From the founding of the See of Lindisfarne, out of which the bishopric and palatinate of Durham arose, the Bishops received large grants of lands, with extensive immunities; and Guthred, king of Northumbria, and Alfred the Great appear to have confirmed the grant to the See of the whole of the land between the rivers Tyne and Wear. There is no evidence of the exercise of *palatine* privileges by the Bishops prior to the Norman Conquest, but it is probable that these were acquired in the reign of the Conqueror, and they were exercised by the Prelates until resumed by the Crown in 1836. Palatine counties are understood to have been erected for the defence of neighbouring kingdoms against the Welsh and Scots, and were in reality self-contained kingdoms in alliance with their creator. The ancient customs of the County Palatine of Durham are in some measure retained, the administrative authority being exercised on behalf of the Crown.

BOARD OF EDUCATION,

Whitehall, London, S.W. 1.

The Government Department of Education was, until the establishment of a separate office, a Committee of the Privy Council appointed in 1839 to supervise the distribution of certain grants which had been made by Parliament since 1834. The Act of 1899 established the Board of Education, with a President and Parliamentary Secretary, and created a Consultative Committee. The cost of administration was estimated at £434,591 in 1923-24, with £256,982 for Inspection and Examination.

EXCHEQUER AND AUDIT DEPARTMENT,

Victoria Embankment, E.C. 4.

This is the Department of the Comptroller and Auditor General, an office created by the Act 29 & 30 Vict. c. 39 (1866) to replace, with extended powers, the separate offices of Comptroller General of the Receipt and Issue of the Exchequer and of the Commissioners for Auditing the Public Accounts. This officer is appointed by Letters Patent under the Great Seal, and is irremovable except upon an address from the Two Houses of Parliament. In his capacity of Comptroller General of the Receipt and Issue of the Exchequer he authorises all issues from the Exchequer after satisfying himself that Parliament has given authority for them. He examines the Exchequer accounts and makes an annual report on them to Parliament. In his capacity of Auditor General of Public Accounts he is charged with the duty of examining on behalf of the House of Commons the accounts of expenditure out of monies provided by Parliament, the accounts of the receipt of revenue, and generally all other public accounts, including the accounts of Government stores and of trading services conducted by Government Departments. The results of his examination of those accounts are reported to the House of Commons.

The net expenses of the Department were estimated to amount to £153,100 in 1923-24.

FORESTRY COMMISSION.

22 Grosvenor Gardens, S.W. 1.

The Forestry Commissioners were appointed under the Forestry Act (1919), and were created a Body Corporate in April 1920. The Commissioners are charged with the general duty of promoting the interests of forestry, the development of afforestation and the production and supply of timber in Great Britain. The act transferred to the Commissioners the powers and duties of the Board of Agriculture and Fisheries, and the Board of Agriculture for Scotland, in relation to forestry, and also the powers of those Departments under the Destructive Insects and Pests Acts, 1877 and 1907, so far as those powers relate to insects or pests destructive only to forest trees and timber. The Forestry Act 1923 provides for the transfer of the Crown Woods and Forests to the Commissioners; it also cancels the condition of repayment to which grants in respect of afforestation were subject under the Act of 1919.

The net estimated expenditure on forestry operations, &c., for the year 1921–22 was £400,000.

FRIENDLY SOCIETIES REGISTRY.

17 North Audley Street, W. 1.

A Barrister was appointed in 1828 to certify the Rules of Savings Banks, and in 1829 to certify those of Friendly Societies. In 1846 he was constituted Registrar of Friendly Societies. By the Friendly Societies Act, 1875, the Central Office of the Registry of Friendly Societies was created, consisting of Chief Registrar and the Assistant Registrars for England. It exercises numerous and important functions under the Friendly Societies Act, the Industrial and Provident Societies Acts, the Building Societies Acts, the Trade Union Acts, the Workmen's Compensation Acts, the Scientific Societies Act, the Trustee Savings Banks and Post Office Savings Banks Acts, the Loan Societies Act, the Shop Clubs Act, and a great number of local and personal Acts. Under the Industrial Assurance Act 1923 the Chief Registrar is charged with various powers and duties in relation to Industrial Assurance Companies and Collecting Societies, and in that capacity is styled the Industrial Assurance Commissioner. Net expenses, 1923–24, £43,445.

GENERAL REGISTER OFFICE
(ENGLAND AND WALES),
Somerset House, W.C. 2.

The Registration of Births, Marriages, and Deaths is believed to have been inaugurated by Thomas Cromwell in 1522, but the Statutes concerning registration are of a comparatively modern date, and were consolidated by 37 & 38 Vict. c. 88. The first Registrar-General was appointed in 1836, his work being enormously increased by the Act of 1874, which made registration compulsory in England and Wales. The Registrar-General is responsible for the taking of the Census and the preparation of the Census Returns. The expenses of the Office, including the Census Office, for 1923-24 were estimated at £179,429. The estimate of receipts from fees for the same period is £20,500.

HOME OFFICE, Whitehall, S.W. 1.

The Secretaryship of State for Home Affairs was created in 1782, the duties having previously been assigned to the "Southern" Secretaryship, which embraced the affairs of Great Britain, Ireland, and the Colonies, and also Southern Europe. By the appointment of the "Home" and "Foreign" Secretaries the duties were divided in accordance with the names of the Offices, the former retaining Irish and Colonial business, and until 1794 War business also. In 1801 the Colonial business was also removed. The Home Secretary is the medium by which the Sovereign acquaints his people of his pleasure, and a channel of communication with the Sovereign, and his main functions are the maintenance of the King's peace, the enforcement of rules made for the internal well-being of the community, and the exercise of the prerogative of mercy.

BOARD OF INLAND REVENUE,
Somerset House, W.C. 2.

The appointment of Commissioners of Stamps dates from 1694 and of Commissioners of Taxes from 1719. By 4 and 5 Will. IV. c. 60, a consolidated Board of Stamps and Taxes was established, and by 12 and 13 Vict. c. 1 this Board was amalgamated with the Commissioners of Excise to form the Board of Inland Revenue. By 8 Edw. VII., c. 16 the administration of Excise was transferred to the Board of Customs. The present sources of "Inland Revenue" consist of Death Duties, Stamps and Taxes. Salaries and Expenses of the Board for 1922-23 are estimated at £7,154,781.

IMPERIAL MINERAL RESOURCES BUREAU.

2 Queen Anne's Gate Buildings, Westminster, S.W. 1.

The Bureau was incorporated by Royal Charter on the 12th June, 1919, and its purposes are: (i) To collect, co-ordinate, and disseminate information as to the resources, production, treatment, consumption and requirements of every mineral and metal. (ii) To ascertain the scope of existing agencies, with a view ultimately to avoid any unnecessary overlapping that may prevail. (iii) To devise means whereby existing agencies can, if necessary, be assisted and improved in the accomplishment of their respective tasks. (iv) To supplement these agencies, if necessary, in order to obtain any information not now collected which may be required for the purposes of the Bureau. (v) To advise on the development of the mineral resources of the Empire or of particular parts thereof, in order that such resources may be available for the purposes of Imperial Defence or Industry or Commerce.

THE VICTORIA AND ALBERT MUSEUM,

South Kensington, S.W. 7.

The history of the Museum may be said to begin in 1852, when the Museum of Ornamental Art was founded at Marlborough House. The collection consisted of certain objects which had been purchased at the 1851 Exhibition, "on account of the excellence of their art and workmanship," at a cost of £5,300, together with other specimens purchased for the use of the various Schools of Design since 1837, and dispersed among them.

Additions have since been made by purchase, gift, and bequest. The older parts of the building were erected between 1860 and 1884; the new buildings were completed in 1909. The administrative expenses were estimated at £127,791 in 1923 24, and were met by a vote under Education, Science, and Art. The branch museum at Bethnal Green (administrative expenses 1923–24, £6,525) was opened in 1872. The buildings were removed from South Kensington, and re-erected on land purchased for the purpose locally.

NATIONAL DEBT OFFICE,

19 Old Jewry, E.C. 2.

The National Debt Commissioners were appointed under 26 Geo. III., c. 31 (1786), by which a permanent Sinking Fund was to be established, and a sum of £250,000 issued quarterly to be applied towards the reduction of the National Debt, being commonly spoken of as "Mr. Pitt's Sinking Fund." In 1829 this was superseded by appropriating the surplus income of the year as the Sinking Fund, and this is commonly known as "The Old Sinking Fund." In 1875 "The New Sinking Fund" was set up by Sir Stafford Northcote (38–39 Vic., c. 45), and this, with the Old Sinking Fund, now mainly operates in reducing the Debt. The Commissioners are at the present time the Speaker, the Chancellor of the Exchequer, the Master of the Rolls, the Lord Chief Justice, the Paymaster-General, and the Governor and Deputy-Governor of the Bank of England. The administrative expenses of the Board were estimated at £18,035 in 1923–24.

Assistant, Capt. H. F. Defrates.

POST OFFICE.

Chief Office, St. Martin's-le-Grand, E.C. 1.

A House of Commons report in 1844 states: "It is uncertain at what precise period the Crown undertook to be the regular carrier of letters for its subjects." The first "Master of the Posts" was appointed in 1516, but the duty was not then undertaken as a remunerative department of the Government. The Post Office is now one of the three great revenue-collecting departments, and while efficiently discharging its multifarious duties, shows a large annual profit. It also receives large sums for duties and taxes on behalf of the Inland Revenue Department, for certain licences for the Customs and Excise Department and the County Councils, and for National Insurance on behalf of the National Health Insurance Commissioners and the Board of Trade. The Post Office also pays Old Age Pensions. The Penny Post was inaugurated in 1840, the Book Post in 1855, the Post Office Savings Bank in 1861, the Post Office Telegraphs in 1870, the Money Order Office in 1792, Postal Orders in 1881, the Parcel Post in 1883, and the Telephone Service in 1892. The expenses of the Post Office (Salaries, Wages, etc., only) were estimated at £37,647,277 in 1923-24.

PRIVY COUNCIL OFFICE, Whitehall, S.W. 1.

The Privy Council is of very ancient origin. A Council, the number of which was about twelve, was instituted by Alfred, 895, and it discharged the functions of State now confined to members of the Cabinet. In the Middle Ages the Chief Advisers of the King who were permanently about him formed the Privy Council. Having become unwieldy, it was reconstituted in 1679 At present it consists of certain eminent persons whose names are given on p. 128. Members of the Cabinet must be Privy Counsellors, and they principally form the acting Privy Council. The Council is summoned as such to act "with others" upon the demise of the Crown, and many matters are referred by the Sovereign to Committees of the Council, some of which are standing Committees, and others constituted to deal with particular cases, *e.g.*, the Judicial Committee, the Board of Trade, *q.v.* The Lord President of the Council is the Fifth Great Officer of State, and as such is always a prominent member of the Cabinet.

PUBLIC WORKS LOAN BOARD,

Old Jewry, E.C. 2.

The Public Works Loan Board was created in 1817 for the purpose of advancing money to Municipal Authorities for Public Works. During the financial year 1922–23 the Commissioners approved loans amounting to £9,718,728, viz., £8,637,245 out of the Local Loans Fund and £1,081,483 out of the Land Settlement (Public Works Loan) Account. Of the total granted out of the Local Loans Fund the sum of £7,022,993 was for purposes of the Housing Acts (as compared with £32,822,787 in 1921–22).

The average annual amount of loans granted by the board during the period from 1875–6 (when the Commission was constituted in its present form) to 1919–20 was £2,906,846 per annum (the lowest amount previously granted being £49,591 in the financial year 1917–18, and the highest £10,956,874 in 1899–1900). The comparison with the total amount advanced by the board during the

103 years from its origin (in 1817) to 1919-20 is striking, for the total amount advanced during this period was only £149,436,402, as compared with £61,643,748 granted during the single financial year 1920-21; and when it is remembered that the 103 years referred to witnessed almost the entire development of local government in England, the comparison appears even more remarkable.

The average rate of interest was:—

Loans granted during 1922-23 to Local Authorities for the purposes of State-assisted Housing Schemes amounted to £11,831,733 for providing Dwellings for the Working Classes during the year, made up as follows:—

(A) Loans Secured on Local Rates.	England. £	Scotland £

QUEEN ANNE'S BOUNTY,

3 Dean's Yard, S.W. 1.

Incorporated in 1704, when Queen Anne, with the consent of Parliament, transferred to the Governors the annual income of the "first fruits" and "tenths" derived from the sees, dignities, and benefices, with a view to the augmentation of insufficiently endowed livings. These charges were originally levied on all clerical incomes and paid to the Pope, but were made part of the Crown revenue by Henry VIII. More than half of the benefices in England and Wales are free from these charges, having either been exempted from them by statute or formed since the charges were imposed. "First fruits" represent one year's income of a benefice in the time of Henry VIII.; the "tenths" an annual sum of a tenth part of that income. The income from this source amounts to about £15,000 per year, which, with the surplus income from capital held by the Governors, is distributed in grants towards the relief of dilapidation assessments on benefices not exceeding £250 in net annual value; the total amount so available for the year ending Dec. 31, 1923, was £27,342. The Governors act as trustees for endowments and many descriptions of Church funds. They are also empowered to lend money upon mortgage of benefices for improvements to parsonage houses and farm buildings, in certain cases for rebuilding chancels, and for dilapidations.

DEPARTMENT OF SCIENTIFIC AND INDUSTRIAL RESEARCH,

16 & 18 Old Queen Street, Westminster, S.W. 1.

The Committee of the Privy Council for Scientific and Industrial Research was appointed by Order in Council dated July 28, 1915, to direct, subject to such conditions as the Treasury may from time to time prescribe, the application of any sums of money provided by Parliament for the organisation and development of Scientific and Industrial Research. The Order in Council also appointed an Advisory Council to whom all proposals for researches stand referred. By Charter dated November 23, 1916, the official members of the Committee of the Privy Council were created a Body Corporate under the name of "The Imperial Trust for the Encouragement of Scientific and Industrial Research" to hold and dispose of money and other property for the purposes of the Committee. On December 15, 1916, a separate Department having its own Parliamentary Vote was created for the service of the Committee. The aggregate net estimate for the Department in 1923-4 amounts to £276,863, a decrease of £20,574 on the same estimate for 1922-3. The gross estimate amounts to £398,593. Salaries and allowances, £32,796; Grants for Research, £50,800; Research Boards Expenses, £53,415; Fuel Research Board, £34,560; Geological Survey of Great Britain, £53,456; Museum of Geology, £7,761; National Physical Laboratory, £164,060.

Geological Survey of Great Britain and Museum of Practical Survey.

Jermyn Street, S.W. 1.

The Geological Survey and Museum was commenced in 1832; it was under the Science and Art Department from 1853 till 1900, when that Department became merged in the Board of Education. On Nov. 1, 1919, the administrative control of the Survey and Museum was transferred to the Committee of the Privy Council for Scientific and Industrial Research. The normal work of the Survey includes the preparation of geological maps and memoirs dealing with tho general survey of the country, and with various economic aspects of that survey. The Museum of Practical Geology conserves and exhibits rocks, minerals and fossils which afford evidence for the published records of the survey or illustrate that survey. It is also a function of the Museum to exhibit economic minerals from all parts of the world.

The National Physical Laboratory,

Teddington, Middlesex.

The National Physical Laboratory was founded in the year 1901 as a public Institution for standardising and verifying instruments, for testing materials, and for the determination of physical constants. Prior to the year 1918, the property of the Laboratory was vested in the President and the Council of the Royal Society, and the Laboratory was controlled by a General Board and an Executive Committee, appointed by the President and Council of the Royal Society, and comprising representatives of the Society and of the great Technical Institutions. As from April 1, 1918, the responsibility for the maintenance of the National Physical Laboratory was undertaken by the Department of Scientific and Industrial Research.

The Laboratory comprises eight main sections:—(1) The *Physics Department* includes divisions for Heat and Thermometry, Optics, Sound, and Radiology. (2) The main divisions of the *Electricity Department* deal respectively with Electrical Standards, General Electrical and Magnetic Measurements, Alternating Current Tests and Research, Direct Current Measurements and Photometry. (3) The *Metrology Department* is responsible for the Laboratory Standards of length, area, volume, and mass, and among the various branches of work dealt with are the verification of standards of length, standard bars, surveying tapes, &c., the testing of engineers' gauges, including screw gauges, measurements of area, volume, and mass, the testing of barometers, hydrometers, taximeters, watches and chronometers, and the highest class of scientific glassware for volumetric measurements. The glassware testing has recently been reorganised on an increased scale owing to the growth in the manufacture of such ware in this country during the war. When the Ministry of Munitions was formed, the Laboratory was called upon to undertake the testing of the gauges for the Ministry; the work assumed very large dimensions, and a special building for its accommodation was provided. (4) The *Engineering Department* carries out research on general engineering problems, especially in relation to the strength and properties of materials under stress; it comprises a laboratory and experimental track for tests of road materials. (5) The *Aerodynamics Department* conducts researches on aircraft models and parts as required by the Aeronautical Research Committee of the Air Ministry; investigations on light alloys and other materials, engines and accessories, seaplane floats, fabrics, &c., are carried out in other departments, especially the Engineering, Metallurgy, and Electrotechnics Departments, and the William Froude National Tank. (6) The *Department of Metallurgy and Metallurgical Chemistry*, in addition to researches on steels, and on aluminium and other alloys, is engaged on researches relating to Optical Glass. The equipment includes a rolling mill for the experimental working of alloys. The Metallurgical building was provided by Sir Julius Wernher in 1910. (7) The *William Froude National Tank*, the gift of Sir A. F. Yarrow for the service of the nation, carries out tests and researches on ship and propeller models for the information of designers and naval architects. (8) *Secretarial.*

BOARD OF TRADE,

Great George Street, S.W. 1.

(See also *Dept. of Overseas Trade*, and *Patent Office.*)

A Board of Trade and Plantations was established by Charles II. in 1660, and in place of this body a Committee of the Council on Trade was established in 1786. The duties of this Committee (which, unlike the other Council Committees, has a president of its own) are to collect Trade Statistics, control the issue of Patents, keep the Standards of Weights and Measures, the non-legal machinery of Bankruptcy, the Registration of Joint Stock Companies, Gas Companies, Lighthouses, and Merchant Shipping, acting under the latter heading as Auditor of the accounts of the Trinity House and the Irish and Northern Lighthouse Authorities. In 1921 the powers and duties of the Ministries of Food and of Shipping were transferred to the Board of Trade.

TREASURY, Whitehall, S.W. 1.

The Lord High Treasurer of England is the Third Great Officer of State, the office having been "in commission" (with certain intervals) since 1612. The Commissioners for executing the office of Treasurer of the Exchequer of Great Britain and Lord High Treasurer of Ireland consist of the First Lord, who, if a Commoner, is usually Leader of the House of Commons, the Chancellor of the Exchequer, and some Junior Lords, with certain Secretaries and a staff of officials. The duties of the First Lord are mainly political, as also are those of the Parliamentary Secretary and the Junior Lords; the duties of the Chancellor of the Exchequer are mainly financial, in that he performs the ancient duties of the Under-Treasurer and, after agreement with the heads of the great spending departments, arranges for the great collecting departments to provide sufficient moneys to meet the needs of the year. The papers are laid before Parliament in the form of a Budget, which the Chancellor opens and expounds to the House, these plans being accepted, modified, or rejected by the House. The amount estimated to pay the salaries and other expenses was £229,133 in 1922-23.

TRINITY HOUSE, Tower Hill, E.C. 3.

Trinity House, the first General Lighthouse and Pilotage Authority in the Kingdom, was a body of importance when Henry VIII. granted the Institution its first charter in 1514, *inter alia* "for the relief, increase and augmentation of the Shipping of this Realm of England." Since that period the duty of erecting and maintaining lighthouses and other marks and signs of the sea has by Royal Charter and Acts of Parliament been entrusted to the Corporation of Trinity House, and until 1874 Masters of the Navy were examined by the Elder Brethren of the Corporation. In the present day, the principal duty of the Corporation of Trinity House, as a Public Department, is the administration of the Lighthouse, &c., Service of England and Wales with certain statutory jurisdiction in regard to lighthouses and other seamarks in Scotland, Ireland, and the Channel Islands, whilst the Corporation are also the chief Pilotage Authority in the United Kingdom, and in their capacity as a private corporation or guild they administer certain Charitable Trusts specifically dedicated to the relief of aged and distressed master mariners and their widows. The Acting Elder Brethren of the Corporation also sit with the Judges of the Admiralty Division of the High Court of Justice, to act as Nautical Assessors in Marine Causes tried in that Court. The Lighthouse Service of the Trinity House is maintained out of the General Lighthouse Fund, this fund being provided by means of special dues called Light Dues, levied on shipping using the ports of the United Kingdom. The accounts in connection with the Lighthouse Service are rendered to the Board of Trade, who have statutory control over the expenditure, and are submitted annually to Parliament. The accounts in connection with the Charitable Trusts are rendered to the Charity Commissioners. In addition to the public and trust funds which they administer, the Corporation have at their disposal certain private funds which are applied to the maintenance of their house on Tower Hill and to other corporate purposes. The Master of the Corporation at the present time is His Royal Highness the Duke of Connaught and Strathearn, K.G. There are ten Acting Elder Brethren, one of whom is a retired officer of the Royal Navy and the other nine are retired Commanders of the Mercantile Marine, and besides two Elder Brethren who have retired from the Active List there are a number of Honorary Elder Brethren, including His Majesty The King and other members of the Royal Family. The ten Acting Elder Brethren, one of whom always is Deputy Master, form the Board which carries out the public and corporate duties of the Trinity House.

VOLUNTARY HOSPITALS COMMISSION,

Ministry of Health, Whitehall, S.W. 1.

The aggregate deficits amounted for 1921 to £295,170 for London, £425,727 for the rest of England and Wales, and £16,557 for Scotland. The total was thus £737,454, as compared with the estimate of £1,000,000 made by Lord Cave's Committee, on which the Government grant of £500,000 was based. The following grants were made in 1923 on the basis of pound for pound of new money raised or in sight, except in a limited number of cases where emergency grants were made to prevent the closing of beds: London, £225,000; rest of England and Wales, £194,242; Scotland, £7,411, giving a total of £426,653. The London hospitals received their full share of the grant, but a balance of £73,347 remained for distribution in the rest of England, Wales, and Scotland. This balance was apportioned on the basis of Lord Cave's estimate, as follows: England and Wales, £45,758; Scotland, £29,589; and will be distributed in accordance with a scheme formulated by the local Voluntary Hospital Committees in England and Wales and the Consultative Committee in Scotland, subject to the Treasury conditions, towards the liquidation of the deficits which accumulated prior to 1921.

Commission appointed July, 1921.

WOODS, FORESTS, AND LAND REVENUES

1 Whitehall, S.W. 1.

Administrative expenses, 1923–24, £32,041.

THE CROWN LANDS.—The Land Revenues of the Crown in the United Kingdom have been collected on the public account since 1760, when George III. surrendered them in return for a fixed annual payment or *Civil List.* At the time of the surrender the gross revenues amounted to about £89,000, and the net return to about £11,000.

In the year ended March 31, 1923, the total Receipts by the Commissioners were £1,503,470, of which amount £1,180,587 was derived from Crown Rents, £10,969 from Windsor Parks and Woods, £56,483 from Royal Forests and Woodlands, and £123,308 from the Mines. The Expenditure was £546,017. The sum of £900,000 was paid to the Exchequer in 1922–23 as *Surplus Revenue*, being a net sum from which no deductions have to be made for administration.

ELEVEN YEARS' LITIGATION.

NUMBER of appeals and causes set down for hearing at the Law Courts at the beginning of Michaelmas Sittings from 1913 to 1923:

(1) *Aggregate of Appeals and Causes.*

Year.	Appeals.	Causes.	Total.
1913	363	1,817	2,180
1914	308	1,465	1,773
1915	236	1,447	1,683
1916	181	1,504	1,685
1917	203	1,566	1,769
1918	165	2,103	2,268
1919	150	3,457	3,607
1920	246	4,302	4,548
1921	211	3,501	3,712
1922	192	2,738	2,930
1923	205	2,246	2.451

(2) *Chancery Division.*

(Actions in each year)

1913	368	1916	301	1919	263	1922	571
1914	328	1917	246	1920	372	1923	487
1915	348	1918	250	1921	513		

The explanation of the higher figures in the later years is that since 1921 this division has dealt with Companies (winding-up matters), and with Bankruptcy matters also, the latter having formerly been heard in the King's Bench Division.

(3) *King's Bench Division.*

In dealing with the King's Bench, account has to be taken of the transfer just mentioned of bankruptcy matters to the Chancery side in 1922.

Year.	Div. Court.	Actions.	Bkrptcy.	Total.
1913	316	510	15	841
1914	195	467	14	676
1915	113	373	12	498
1916	142	449	8	599
1917	137	312	9	458
1918	183	536	2	721
1919	192	852	5	1,049
1920	152	965	8	1,125
1921	289	1,603	—	1,892
1922	154	1,082	—	1,236
1923	184	731	—	915

(4) *Probate, Divorce and Admiralty.*

The increases are attributable mainly to the gradually extended facilities given to Poor Persons to bring proceedings. Probate cases form but a small proportion of the aggregates.

Year.	Prob, & Div.	Admiralty.	Total.
1913	528	22	550
1914	389	32	421
1915	515	38	553

THE NAVY ESTIMATES, 1923-24.

£58,000,000 *net*; Decrease on 1922-23, £6,883,700.

The Navy Estimates for the financial year 1923-24 provide for a net expenditure of £58,000,000 as compared with £64,883,700 *net* in the year 1922-23. Provision is made for 99,500 officers and other ranks, in addition to 1423 Coastguard and Marine forces.

There is no shipbuilding programme. Although other countries, including the United States, France and Japan, are building large light cruisers, destroyers, and submarines in large numbers, the Board of Admiralty asked Parliament's assent merely to "preparatory work on a submarine," for permission to complete the ships begun during the War, and to advance the two new battleships (H.M.S. *Nelson* and *Rodney*). The other work in hand during the year is the *completion* of 1 light cruiser, 2 flotilla leaders, 3 destroyers, 4 submarines, and 2 aircraft carriers; the *advancement* of 2 battleships, 3 light cruisers, 2 submarines and 1 mine-layer; and the *beginning* of 1 submarine.

The British vessels exclude those earmarked for disposal, and include six Commonwealth vessels and two Dominion of Canada vessels. Four of the forty-nine French submarines have been condemned. Italy, the return for which excludes vessels earmarked for disposal, projects building four, and in the case of Russia the twenty-three in the course of construction include "one assembling, two in cases at Nikolaeff, twenty Petrograd—uncertain."

The Army.

THE WAR OFFICE.

Whitehall, S.W. 1.

The business of the War Office proper appears to have been originally entrusted, about 1620, to a Committee of the Privy Council; the Clerk in attendance on that Committee being the Secretary at War. The Secretary at War had immense power in military matters, as holding the purse; but neither the Commander-in-Chief nor the Board of Ordnance was subject to him. In 1794, a Secretary of State was first appointed. The Office of Secretary at War was not terminated at this date, but, from 1855, it was amalgamated with that of Secretary of State for War until, in 1863, it was formally abolished by Act of Parliament.

In 1801, the Secretary of State for War was also given the business of the Colonies, of which he was relieved in 1854 by the appointment of a Secretary of State for the Colonies.

In 1855, the Commissariat Office, which was only a semi-military branch of the Army with headquarters at the Treasury, was transferred to the War Department; the Board of Ordnance was abolished, after an existence of more than three centuries; and the Board of General Officers and the Army Medical Department were also successively absorbed into the War Department. The year 1870 witnessed the final welding into one War Office of the civil administrative functions of the Secretary of State and the military administrative functions hitherto exercised at the Horse Guards. In that year, the War Office Act vested the direct and immediate control of every branch of Army administration in the Secretary of State. Before the appointment of a Secretary of State, the military control of the Army was, to a very great extent, in the hands of the Commander-in-Chief, who was subordinated to the Secretary of State from 1895 until the abolition of the Office in 1904. In 1904, an Army Council was created by Letters Patent, and to this Council were thereby transferred all the powers exercised under the Royal prerogative by the Secretary of State for War and the Commander-in-Chief. Statutory powers were transferred by the Army (Annual) Act of 1909 (9 Edw. VII. C. 3).

THE AUXILIARY FORCES.

THE MILITIA.

In 1907 the "Old Constitutional Force" known as the "Militia" was transformed into the "Special Reserve," but the following Militia units were retained :—The Royal Malta Artillery, the Bermuda Militia Artillery, the Channel Islands Militia, and the Malta Militia. In 1921 the terms "Special Reserve (and Extra Reserve) Battalions" were abolished, and "Militia" restored, but no appointments are at present made to the force, which comprises the following units :—

Cavalry.—1 Regiment (King Edward's Horse).
Artillery.—R.F.A. and R.G.A.
Royal Engineers.—All branches.
Infantry.—The 3rd Battalion of Infantry Regiments of the Line (and in some cases the battalion next in numerical order) is specially retained as Militia.

THE TERRITORIAL ARMY.

In 1907 the "Yeomanry" and the "Volunteers" were transferred into the Territorial Force, which included English, Welch, and Scottish Cavalry ; Royal Horse, Royal Field, and Royal Garrison Artillery ; Royal Engineers ; Infantry ; Royal Army Service Corps and Royal Army Medical Corps. In 1921 the title was changed to "Territorial Army."

Territorials in the War.—The strength of the Territorial Force in July, 1914, was about 265,000. During the Great War 310 new units were formed, and there passed through the ranks of the force about 50,000 officers and 1,000,000 other ranks. The Territorial Force suffered total battle casualties of 27,000 officers, and nearly 600,000 other ranks, of which some 6,600 officers and 106,000 other ranks were killed. Among the war honours gained by officers and men of the Territorial Force were 70 Victoria Crosses.

STRENGTH OF THE ARMY.

Army Estimates of the effective and non-effective services for 1923-24 show the number of men on the Establishment of the British Army at 170,800, including 10,500 Indian troops in Iraq, which are borne on the Army vote for technical reasons. The establishment in 1922-23 was 215,000, this figure including 20 Cavalry Regiments, 162 Batteries of Artillery, 10 Guards Infantry Battalions, 162 Infantry Battalions, and ancillary and auxiliary services.

Including permanent staff, the *Territorial Army* consists of 14 Divisions, the Artillery comprising batteries of 4 guns, and the Infantry Battalions having an establishment of 21 Officers and 637 other ranks. Included with this force is an *Air Defence Force* of 220 Officers and 2,708 other ranks. On Feb. 1, 1923, the total strength of the Territorial Army was 134,452 all ranks.

Cadet Corps.—Owing to the present financial stringency it has been found impossible to continue the annual grants hitherto given to cadet units recognised by the War Office, but it is not proposed to withdraw in 1923-24 the privilege of camp equipment for summer camps. On Oct. 1, 1922, the number of cadets serving in the Officers' Training Corps was :

Senior Division	2,822
Junior Division	32,233

as compared with a total of 34,330 on the corresponding date of 1921 and a total of 27,023 in October, 1913.

COST OF THE ARMY.

The Army Estimates for 1923-24 provide for an expenditure of £52,000,000, a reduction of £10,300,000 compared with the year 1922-23. The total of the financial estimate is made up of Current Effective Charges £40,894,000, Non-Effective Charges £7,518,000, and Terminal Charges of the Great War £3,588,000.

The principal heads of cost in the present and the last Estimates are as follows :—

	1923-24. Net Estimate.	1922-23. Net Estimate.
Standing Army	£28,132,000	£35,351,300
Territorial Army and Reserve Forces	7,200,000	8,083,000
Educational, &c., Establishments, and Hospitals, Depots, &c.	7,416,000	9,211,000
War Office, Staff of Commands, &c.	2,691,000	3,355,500
Terminal and Miscellaneous Charges and Receipts	1,982,000	6,819,100
Half Pay, Retired Pay, Pensions, and Civil Superannuation	7,518,000	8,617,200

The Estimates include a repayment by the Colonial Office of £4,930,000 for expenditure in the Middle East, which, with one or two minor adjustments, brings down the actual savings to the sum of £10,300,000 mentioned above.

THE ARMY AND THE GREAT WAR.

The total number of men recruited in the three kingdoms from Aug. 4, 1914, to Nov. 11, 1918, was 4,970,902. The contributions of the various countries, and the percentage of enlistments to population, were as under:—

	Numbers Recruited.	Percentage of Total Popul'n.	Percentage of Male Popul'n.
England	4,006,158	11·57	24·02
Wales	272,924	10·96	21·52
Scotland	557,618	11·50	23·71
Ireland	134,202	3·07	6·14

The number of men granted exemption was 2,741,988, of whom 2,169,707 were classed as in reserved occupations.

At Oct. 1, 1918, the aggregate strength of the Army, including the Territorial Force, but exclusive of Dominion and Indian troops, was 3,838,265, of whom 147,738 were officers. The *maximum* strength was attained at the beginning of 1918, when the total stood at 3,887,649—154,777 officers and 3,732,872 other ranks.

The distribution of the Army on Oct. 1, 1918, was as follows:—

	All ranks.		All ranks.
Home	1,427,069	Egypt	199,842
Colonies	16,995	Mesopotamia	111,283
India	83,878	Russia	3,547
France	1,763,980	East Africa	8,737
Italy	73,735		
Salonica	149,189	Total strength	3,838,265

Casualties in all theatres of operations from Aug. 14, 1914, to Sept. 30, 1919, totalled 2,471,152.

	Officers.	Other ranks.
Killed	33,337	540.170
Wounded	74,082	1,569,387
Missing	9,362	244,814
Totals	116,781	2,354,371

Of the last category, 5,215 officers and 149,093 men, reported as prisoners of war, were released.

The *Official Termination of the War*, when all Treaties of Peace had been ratified by the respective Governments, was Aug. 31, 1921.

COST OF THE GREAT WAR.

In the House of Commons the Chancellor of the Exchequer (Mr. S. Baldwin) gave the following figures showing the cost of the Great War to the United Kingdom and the War Loans to the Allies and Dominions:—

EXPENDITURE DURING THE WAR.

The figures are only available for complete financial years. The Exchequer issues between April 1, 1914, and March 31, 1919, were £9,590,000,000, and the money was raised approximately as follows:—

From direct taxation	£1,820,000,000

CIVIL AVIATION.

RETURNS supplied voluntarily by civil aerial transport firms in the United Kingdom for the year 1922 show that for Great Britain and on the Continental route 17,634 flights were made, the mileage totalling approximately 944,000, of which 717,000 was over regular air routes. The number of passengers carried was 36,326, and the weight of goods carried amounted to 214·6 tons. During this period 55 pilots were licensed for the first time and 216 licences were renewed, the number of licences current at the end of the year being 113; 151 aircraft were licensed for the first time and 90 licences were renewed, the number of licences for aircraft in force at the end of the year being 170.

The following figures show the proportion of accidents to aircraft flying for hire or reward:—

Accidents reported	2
Approximate machine miles per accident	420,000
Approximate machine flights per accident	8,800

In these two accidents one pilot was killed and one of the crew; one passenger and one of the crew were injured. There were no casualties to third parties. In all British civil flying, whether for hire or reward or not, three pilots were killed and two injured; two crew were killed and one injured; two passengers were killed and five injured.

THE METEOROLOGICAL OFFICE.

The Meteorological Office was established as a Department of the Board of Trade in 1854. Changes have been made from time to time in the management, and in 1919 the Office was attached to the Air Ministry. The control is vested in a Director and Committee appointed by the Air Council. The Gassiot Committee of the Royal Society is an Advisory Committee for geophysical subjects. The work of the Office includes:—The collection and discussion of meteorological observations from oceans and land areas all over the world; the maintenance of a number of stations for daily telegraphic reports upon which gale warnings and forecasts are based; the maintenance of observatories for the study of weather, with which are associated other geophysical subjects; and the maintenance of stations in various parts of the country for the supply of meteorological information and other requirements of aircraft. The responsibility for the work of the British Rainfall Organisation was transferred to the Meteorological Office in July, 1919.

OCTOBER STORMS.—The unusually stormy character of the weather experienced in October on the South Coast of England is reflected in the official statistics issued at the Brighton meteorological station. The total registration of sunshine for the month was 95·6 hours, as against the average of 119·8. This is the lowest registration since 1918. The best day's record was 8·5 hours; and six days were sunless. The highest temperature did not exceed 64·4°, and the average maximum for the month was 58·1°, as compared with an average for 46 years of 82·3° In 1919 the average for October was 64·4°. Rain fell on twenty occasions during October, the total measurement being 6·88 in., as compared with the average of 3·46 in. These are the highest figures since 1909, when the total was 8·12 in.

THE NATIONAL ASSEMBLY.

12, Dean's Yard, Westminster, S.W. 1.
(Hours 10 to 5.)

UNDER the *Church of England Assembly (Powers) Act*, 1919, there is a National Assembly to deliberate on all matters concerning the Church of England—not to deal with spiritual doctrines or the duties of the Ministry, but with the framework and rules within which the Church works. The Act gave power to set up an Assembly consisting of three Houses, composed of the Bishops, the Clergy and the Laity respectively. The first two Houses consist of the Convocations of Canterbury and York, of which the respective Upper Houses form the *House of Bishops*, and the respective Lower Houses the *House of Clergy ;* the *House of Laity* comprises representatives of the Laity of the Provinces of Canterbury and York, elected every five years by the Lay members of the Diocesan Conference, which consists of representatives elected by members of the Church of England on a roll prepared in each parish.

The *Church Assembly* is free to discuss any proposal concerning the Church of England, and to make provision in respect of such matters, but where this includes Parliamentary sanction for any alteration contemplated, this authority is to be sought in the statutory manner. It is specially provided that any innovation touching doctrinal formulæ, or the services or ceremonies of the Church, or the administration of the Sacraments or sacred rights thereof, must be debated and voted upon by each of the three Houses sitting separately, and must then be either accepted or rejected by the Assembly in the terms in which it is finally proposed by the House of Bishops. It is further laid down that the Assembly or any of the three Houses may debate and formulate its judgment by resolution upon any matter concerning the Church, or otherwise of religious or public interest, but the Assembly may not issue any statement purporting to define the doctrine of the Church on any question of theology. None of the powers belonging to the Convocations of Canterbury and York is to be diminished or derogated by the Assembly, which is also prohibited from exercising any power or performing any function distinctively belonging to the Bishops by right of their episcopal office.

Parochial affairs are managed under the Act by Parochial Church Meetings of parishioners who are full members of the Church of England and by Church Councils elected by such meetings.

Central Board of Finance.—Receipts on 1922 account amounted to £66,079, of which sum diocesan contributions accounted for £47,417. Payments reached a total of £121,797, leaving a debit balance of £55,718. Below are the principal details of expenditure :

ST. PATRICK'S NATIONAL CATHEDRAL, DUBLIN.

Dean and Ordinary, Very Rev. Charles Thomas Ovenden, D.D.

GENERAL SYNOD,

onsisting of House of Bishops (13) and House of Representatives (viz., 208 clerical and 416 lay).

Honorary Secretaries, Ven. L. A. Pooler, D.D.; J. A. Maconchy; Major E. H. C. Wellesley and Rev. C. K. Irwin, B.D.

Secretary to the REPRESENTATIVE CHURCH BODY (INCORPORATED 1870), A. F. Maude, 52 St. Stephen's Green E., Dublin; *Asst. Sec.* Canon R. A. Kernan B.D.

By the Act of Union, 1800, the Church of eland was united with the Church of England, d the Sovereign, as one of its members, supreme vernor on earth. By the Act of 1869 this union as severed, and on Jan. 1, 1871, the Church of eland resumed her independent position. The t of 1869 not only disestablished the Irish urch, but also took away her endowments, thing being left but the right to the life services the Annuitant Bishops and Clergy (which were mmuted for a capital sum), the right to claim urches in use for divine service, the right to y the See and Glebe Houses (with garden d curtilage), and £500,000 in lieu of private dowments.

The supreme governing body of the Church Ireland is the GENERAL SYNOD, which meets nually.

Subject to the GENERAL SYNOD are 23 *Diocesan nods*, which are assisted by smaller elected dies called Diocesan Councils.

The Bishop of the Diocese is chosen by the erical and lay members of the *Diocesan Synod*. e Primate is chosen by the House of Bishops om amongst their own number.

The incumbent of the Parish is appointed by a *oard of Nomination*, consisting of 7 persons, *z.*:—The Bishop, 3 diocesan nominators (2 erical and 1 lay) appointed by the Diocesan nod, and 3 parochial nominators (lay) appointed the registered vestrymen of the parish.

The financial trustees of the Church are the REPRESENTATIVE BODY, composed of the Archbishops and Bishops, 13 clergymen and 26 laymen, chosen by the Diocesan Synods, with 13 co-opted members (clerical or lay). This body holds the property of the Church, and administers its funds, subject to the General Synod.

The first property it held was the capital sum £7,581,075, representing the life annuities of the Bishops and Clergy paid over as commutation money by the Church Commissioners, and also £500,000 compensation for private endowments. The commutation capital on Dec. 31, 1922, was only £78,612, charged with annuities to 24 annuitants. The funds, however, in the custody of the Representative Body amounted in all to £9,991,856, made up of *Commutation* £78,612, *Private Endowments* £342,470, *Parochial Sustentation* £6,737,416, *Episcopal Sustentation* £561,731, *General Synod Funds* £620,936, and *Miscellaneous purposes* £1,993,161.

Since 1869 members of the Church have paid in to the Representative Body a total sum of £9,200,019. The interest of the Diocesan and Parochial Sustentation and other Funds is approximately £338,230. The total amount of *assessment* for stipend paid by parishes, 1922, was £113,703, and the total amount paid for *stipends* under Diocesan Schemes was £344,607.

The number of members of the Church of Ireland, by the Census of 1911, was 524,375, or 12·0 per cent. of the entire population.

The Church of Scotland.

The Church of Scotland by law established is Presbyterian in constitution, and is governed by Kirk Sessions, Presbyteries, Synods, and the General Assembly, which consists of both clerical and lay representatives from each of the Presbyteries, and also from the Universities and lay representatives from the Royal Burghs. It is presided over by a Moderator (chosen annually by the Assembly), to whom the King has granted precedence in Scotland, during his term of office, next after the Lord Chancellor of Great Britain. The Sovereign is represented by a Lord High Commissioner (appointed each year by the Crown), who receives the sum of £2,000 towards his expenses. The country, for Church purposes, is divided into 16 Synods and 84 Presbyteries, and there are about 1,828 ministers and licentiates engaged in ministerial and other work. The Church population exceeds the aggregate of all the other Presbyterian bodies, and is estimated at about half the whole population of Scotland; the number of communicants at the close of 1922 was 751,870. The sum of £767,424 was raised in 1922 for church and missionary purposes. Within the last 50 years 503 chapels, at a cost for stipend of over £2,400,000, have been endowed and erected into parishes *quoad sacra*. The parish churches number 1,463. There are in addition 241 churches and mission stations, in all of which worship is regularly conducted.

Until 1560 the Church of Scotland was Roman Catholic, but in that year the Scots Parliament abolished the jurisdiction of the Pope, proscribed the Mass, and ratified a Confession of Faith drawn up by John Knox and other divines. In it all essential articles of the ancient creeds of the Church were adhered to. Ceremonies were declared to be temporary in their nature, and should be altered when they began to foster superstition. Presbytery was settled in 1590. The restoration of the rights of the Bishop civil and ecclesiastical, was, however, sanction by the General Assembly of 1610, and thr Scottish Bishops were in that year cons crated in London. Further innovations by Kin James VI. alarmed the people, and the a tempt of Charles I. to impose on the Church Book of Canons and a Liturgy was met by th *National Covenant* and the restoration Presbyterian forms, which culminated in th *Westminster Confession of Faith* in 1646. At th Restoration the Church again became Epi copal, but in 1690 the Scottish Parliamen re-established Presbyterianism. By the Treat of Union between England and Scotland (ratifie by the English Parliament 6 Anne c. ii.) th Church of Scotland was secured in its Presbyterian form, and the very first official act of sovereign of the British Empire on his *accessio* is to take an oath to maintain inviolably thi settlement. In 1921 Parliament passed th *Church of Scotland Act*, 1921, to declare the lawfulness of certain articles declaratory of the constitution of the Church of Scotland. The article have been framed with a view to facilitatin union among Presbyterian Churches in Scotland A committee, appointed by the Secretary fo Scotland (under the Presidency of Viscoun Haldane) enquired into the question of endowments, with a view to legislation in regar thereto, and legislation on the lines of tha Committee's report is likely to follow.

OTHER PRESBYTERIAN CHURCHES.

(1) *The United Free Church of Scotland* was formed by the Union on October 31st, 1900, of the *Free Church of Scotland* and the *United Presbyterian Church*. The United Church, by rearrangement of the Synods and Presbyteries, has 12 Synods and 64 Presbyteries, and 2 Continental Presbyteries. The Supreme Court is the General Assembly, which meets every year at the same time as that of the Established Church. In the year ending 31 Dec., 1921, there were 1,482 congregations and 42 preaching stations. The total membership was 531,849, and there were 2,038 Sunday Schools, with 197,817 scholars and 22,935 teachers. In 17 Foreign Mission Fields there are 399 European Mission Agents and 5,152 native pastors, evangelists, and teachers, including in both cases those of the Women's Foreign Mission. The income of the Church at the close of last financial year amounted to £1,455,655 at home, and £201,602 abroad.—*Moderator* (1923-4). Rev. Principal Cairns, D.D.—*Offices*, 121 George Street, Edinburgh; and 232 St. Vincent Street, Glasgow.

(2) *The Presbyterian Church in Ireland.*—According to the Census of 1911, the members of the various Presbyterian churches in Ireland were 439,876. The largest of these, under the superintendence of the General Assembly, consists of 35 presbyteries, 609 ministers, 559 congregations, with 108,104 communicants, 91,659 families, 7,496 Sabbath-school teachers, and 102,206 scholars During the year 1922-23 this branch contribute by congregational effort £372,676 for religious charitable, and missionary purposes. The tota income for the year for all purposes was £469,17 It possesses two Colleges, with power to confe Theological Degrees, comprising a staff of 12 professors and 2 lecturers, and has 31 ministerial wit 3 medical and industrial missionaries in foreig parts.—*Moderator*, Rt. Rev. George Thompson D.D. *General Secretary*, Rev. W. J. Lowe D.D., Church House, Belfast.

(3) *The Presbyterian Church of England* ha 14 presbyteries, 350 congregations, 9 preachin stations, and 84,462 members. It has a Theological College (Westminster College, Cambridge) and supports 89 missionaries abroad, including 4 women. In 1922 the amount raised for all purpose was £404,063.—*Church Offices*: 15 Russell Square W.C. 1. *Moderator* (1923-4), Rev. Prof. Anderso Scott, D.D. *Gen. Sec.*, Rev. W. Lewis Robertson M.A. *Fin. Sec.*, Percy Graham. *Pubs. Office*, 2 Warwick Lane, Paternoster Row, E.C. 4.

(4) The less numerous divisions are: The *Fre Church of Scotland*, consisting of those member who did not unite with the U.P. Church; the Reformed Presbyterian Synod, the Easter Reformed Synod, the United Original Seceders the Secession Presbytery in Ireland, and the Synod of the Church of Scotland in England.

The Methodist Churches.

UNDER the general designation of METHODISTS are included all those religious bodies which owe their existence, directly or indirectly, to the efforts of the Revds. John and Charles Wesley. The most numerous and influential of them are—

WESLEYAN METHODISTS.

1. *Wesleyan Methodists*, the original body founded in 1739 by these two brothers. The first *Conference*, consisting of six clergymen and four laymen, was held in 1744. Since then the growth of Methodism has been great, its present adherents being given as 32,000,000. The latest statistics are: Ministers, 56,494; local preachers, 97,531; members and probationers, 10,386,972; Sunday schools, 94,857; officers and teachers, 922,361; scholars, 9,182,637; churches and other preaching places, 100,130. The conference is now composed in its Representative Session of 300 ministers and 300 laymen, with a ministerial president and secretary at its head, elected year by year. The Wesleyans are governed primarily by the Conference, secondarily by the Synods, which are semi-annual meetings of the ministers and selected laymen in each district, over which a chairman is appointed by the Conference, and thirdly by quarterly meetings of the ministers and lay officers of each circuit. The authority of both these last meetings is subordinate to the Conference, which has the supreme legislative and judicial power in Methodism.—*Pres.*, Rev. T. Ferrier Hulme, M.A.; *Sec.*, Rev. Thomas Kirkup.

THE PRIMITIVE METHODISTS.

2. *The Primitive Methodists*, who sprang up in Staffordshire, in 1810, under the leadership of Hugh Bourne and William Clowes. Owing to the excesses attending certain outdoor services called "camp meetings," the Wesleyan Conference prohibited the continuance of the practice. Bourne and Clowes refused to comply with this decision, and were in consequence expelled. They and their sympathisers banded together in a new body, with enlarged powers for the laity. Next to the Wesleyans they are the most numerous and the most democratic of all the denominations which have arisen out of the Methodist movement.—*President*, Rev. G. Armstrong.

THE UNITED METHODIST CHURCH.

3. *The United Methodist Church* was formed by the Union in 1907 of three denominations of Methodists, which hitherto had been separate from and independent of each other. These were:—

The Methodist New Connexion, which owed its origin in 1797 to the Rev. Alexander Kilham, one of the early itinerating Wesleyan preachers. He demanded that the members of the societies, and not the Conference, should be constituted the source of all power in Methodism; and that the Conference should consist of lay as well as ministerial members, all of whom should be elected by the members of the various societies as their delegates. He was expelled by the Conference, and at once founded a new community.

The Bible Christians, founded in 1815 by William O'Bryan, a Wesleyan lay preacher in Cornwall. They existed mainly in the West of England.

The United Methodist Free Churches, which was itself an amalgamation of three different secessions—the Protestant Methodists, formed in 1828; the Wesleyan Methodist Association, which sprang out of a controversy in 1834, concerning the need for a trained ministry; and the Wesleyan Reform Association, founded in 1849, during a great agitation. A strong opposition to the leading Wesleyan officials was organised, which found expression in Conference debates, but more strongly in anonymous and bitter pamphlets, which were widely circulated. On suspicion of being the authors and circulators of these pamphlets three ministers were expelled. They found so many sympathisers that over 100,000 members seceded to found a new denomination.

An Act of Parliament was secured in 1907 to authorise the union of these three denominations into one, to be called the United Methodist Church, and to provide for the government of the Church by a Conference consisting of an equal number of ministers and laymen, elected by districts. The act of union took place in London on September 17, 1907, when the first united Conference was held. About 700 delegates were present. A deed was adopted and signed, declaring the terms of union, defining the constitution and doctrinal tenets, and containing provisions for government and discipline.—*President*, Rev. Charles Pye; *Secretary*, Mr. L. Crowther.

INDEPENDENT METHODISTS.

4. *Independent Methodists.*—This body is Congregational in its organisation, with an unpaid Ministry. Its first Conference was held in 1805.—*President*, T. Lomax.

WESLEYAN REFORM UNION.

5. This Union is Methodist in doctrine, Congregational in government, with, if any church desires it, a paid ministry. It is the remnant of the original reformers who seceded from Wesleyan Methodism in 1849. The adherents are mainly in the Midland counties.—*President*, Rev. G. E. Stone.

FINANCES.

Finances.—The *Wesleyans* raised in 1921–22 £301,381 to sustain their very extensive missionary operations. At the same time their Home missionary income was £53,447. The *Primitive Methodists* raised £2,113 for new chapels, and the *United Methodist Church* £10,050 for their missions.

The Calvinistic Methodist (Presbyterian) Church of Wales.

The CALVINISTIC METHODIST OR PRESBYTERIAN CHURCH OF WALES is the only Church of purely Welch origin, and embraces a very large section of the Welch-speaking population. Its form of government being Presbyterian, it is in federation with the Presbyterian Church of England, the United Free Church of Scotland, and the Presbyterian Church of Ireland. It is also a constituent of the Pan-Presbyterian Council or Alliance. It has foreign missions in Assam, India, and in Brittany.

In 1922 the body numbered—churches, 1,486; chapels and other buildings for Sunday-school branches, 1,779; ministers and preachers, 1,161; elders, 7,101; communicants, 187,260; on probation, 1,801; Sunday-school teachers and officers, 24,290; teachers and scholars, 189,202; adherents (including communicants), 319,484.

Contributions in aid of the Ministry in 1922, £206,487. For various religious purposes (including the ministry), £495,240.

One of the features of the Welch churches is the Sunday-school, which is attended by adults as well as children; the vernacular is the language used generally in these schools.

The English branch of the Church has 382 chapels and preaching stations, with 33,232 communicants and 85,131 adherents (including communicants). All the rest are Welch.

The churches in Assam number 1,026; communicants, ; 60,088 adherents (including communicants), 67,117. The adherents in Brittany are few.

Moderator (*South Wales*) *Synod*, Rev. R. R. Roberts, B.A., Cardiff; (*North Wales*), Rev. E. O. Davies, B.Sc., Llandudno.

Moderator of General Assembly, Rev. W. Jones, Aberdulais.

Statistical Secretaries, Rev. D. E. Thomas, Llanstephan, and Rev. Richard Thomas, B.A., Bontnewydd.

The Independents and the Baptists.

The INDEPENDENTS, or CONGREGATIONALISTS, are the most ancient community of Dissenters. In 1831 the majority of their churches were formed into the Congregational Union of England and Wales, incorporated in 1902, and in 1920 nine districts were formed, each under a Moderator. There are 51 county and other Associations in England and Wales, with 4,701 churches and preaching stations containing 1,727,442 sittings; the number of ministers in the British Isles is 3,062. *Chairman of the Congregational Union of England and Wales*, 1923-24, Rev. Dr. A. R. Henderson; 1924-25, Rev. Arthur Pringle. *Secretary*, Rev. Sidney M. Berry, M.A. *Chief Clerk*, C. Stancliff. *Office and Publication Department*, 22, Memorial Hall, Farringdon Street, E.C. 4.

The *Countess of Huntingdon's Connexion*, with 40 chapels and mission stations, is governed by nine trustees assisted by an annual conference of ministers and delegates. *Secretary*, E. Dolby Shelton. *Offices*, 41, Holborn Hall, Gray's Inn Road, W.C. 1.

The BAPTISTS are, in all respects but one, similar to the Congregationalist; they have the same form of Church government, and differ but in one point of practice—viz., the Baptism by immersion of believers only. Like the Congregationalists, they are for the most part grouped in associations of churches, and the majority of these belong to the Baptist Union, which was formed in 1813. In the British Isles there were, in 1922, 4,173 chapels and 2,039 pastors. The members numbered 404,797, Sunday-school teachers 58,114, and Sunday scholars 523,805. In the United States the "members" alone number 7,966,837 *President of the Baptist Union*, 1922-23, Rev. W. E. Blomfield, D.D. *Secretary*, Rev. J. H. Shakespeare, D.D. *Office*, Baptist Church House, Southampton Row, London, W.C. 1.

Minor Religious Denominations.

MINOR RELIGIOUS DENOMINATIONS.—The chief are the **Unitarians**, with about 350 ministers, 345 chapels and other places of worship. *Gen. Sec.*, Rev. S. H. Mellone, D.Sc., Essex Hall, Essex Street, W.C. 2. The **Brethren** (divided into two bodies, "Open" and "Exclusive") number about 80,000, of whom five-eighths belong to the "Open" body. The **Society of Friends (Quakers)**, consists of 19,027 members and has 384 places of worship in Great Britain, with 26 places of worship in Ireland and 2,281 members. *Central Offices* (*Great Britain*), 136 Bishopsgate, E.C. 2, (*Ireland*), 6 Eustace Street, Dublin. The **Churches of Christ** have 14,277 members and 186 churches in the British Isles, with 159 Sunday Schools, 1,719 teachers, and 16,811 scholars. The **Moravian Church** (*Offices*, 32 Fetter Lane, E.C.) has in the U.K. 43 congregations and preaching stations, with 3,680 communicants. The **Catholic Apostolic Church** has above 80 churches, including a fine Gothic building in Gordon Square, W C.; the **New Church** (**Swedenborgian**), 75 societies, with about 6,700 registered members; the **Latter-Day Saints** (**Mormons**) have 82 churches. The **Reformed Episcopal Church** originated in the U.S.A. (1873) and uses a revised Prayer Book; it is now working on Evangelical lines in U.S.A., Canada, Great Britain and India. *Presiding Bishop in England*, Rt. Rev. F. Vaughan, D.D., Ch. Ch. Rectory, Harlesden, N.W. 10; *Assist. Bishop*, Rt. Rev. J. Louis Fenn, LL.D.; St. Jude's Church, Balham, S.W.; *Gen. Sec.*, Rev. F. L. Grosvenor, B.A., Emmanuel Church, Warrington. The **Old Roman Catholic Church**: *Archbishop in Great Britain*, Most Rev. Bernard Mary Williams, The Edge, Stroud, Glos. The **Greeks** (*Bishop of Central and Western Europe and the United Kingdom*, Archbishop Germanos; *Great Archimandrite*, Very Rev. C. Pagonis, St. Sophia's Vicarage, Moscow Road, W. 2) have churches in London, Manchester, Liverpool, and Cardiff. The **Armenians** have a church in London (S. Sarkhis, Iverna Gardens) and in Manchester; the **French**, **Dutch**, **Swedes**, and **Swiss** in London, Norwich, and Canterbury; and there is a mosque for **Moslems** in London.

The Jews. — Among the inhabitants of the United Kingdom are about 300,000 Jews, mainly in London and other large towns, who possess 200 synagogues, with about 200 ministers and readers. *Chief Rabbi*, Very Rev. Dr. J. H. Hertz. Chief Rabbi's Office, 4, St. James's Place, Aldgate, E.C. 3. The Jews support their own poor. Their number throughout the world is computed at 14,000,000.

The Roman Catholic Church.

In *England* and *Wales* there are 4 Archiepiscopal and 13 Episcopal Sees; in *Scotland* 2 Archiepiscopal and 4 Episcopal Sees; in *Ireland* 4 Archiepiscopal and 24 Episcopal Sees. In the *British Empire* there are 38 Archiepiscopal and 117 Episcopal Sees, with 55 Vicariates and 13 Prefectures.

The *Catholic Directory* of 1924 estimates the Catholic population of England and Wales (1921) at 1,965,787, Scotland 601,304, Ireland (Census figures 1911) 3,242,670. The figures for India (1922) are 2,256,454, Ceylon (1921) 367,350, Canada (1921) 3,383,663, Australian Commonwealth (1921) 1,172,661, New Zealand (1921) 93,023, and Union of South Africa (coloured pop. 1911, whites 1918) 90,764, the total for the British Empire being 14,825,210; and the Catholic population of the world is estimated at 324,328,408.

SCHOLASTIC ASSOCIATIONS.

THE HEAD MASTERS' CONFERENCE (*Secy.*, W. A. Bulkeley-Evans, C.B.E., M.A., 5 Paper Buildings, Temple, E.C. 4.).—The object of the Conference is the discussion of educational questions which affect such schools as are in close connexion with the Universities of Oxford and Cambridge. In considering what Schools shall be included in the List, or removed from it, the Committee will have regard to the Scheme or other Instrument under which the School is administered, the numbers in the School and, in the case of Schools in Great Britain and Ireland, the number of resident Undergraduates of Oxford and Cambridge educated at the School. The Committee may also take into account the proportion of boys in the School, who, having passed the School Certificate or other equivalent Examination, are continuing their studies beyond that stage. The annual meetings are, as a rule, held in December, alternately (*a*) at some school represented on the Conference, (*b*) at London or some University town.

THE INCORPORATED ASSOCIATION OF HEAD MASTERS, 29 Gordon Square, W.C. 1. (*President* (1923), R. F. Cholmeley, O.B.E., M.A. *Joint Hon. Secs.*, W. Jenkyn Thomas, M.A.; F. R. Hurlstone Jones, M.A.).—The qualification for membership is the holding of the head mastership of a Public Secondary school for boys in England or Wales administered under a definite form of public or corporate control by a governing body which has powers both to control the school finances and to appoint and dismiss the head master.

THE SCHOOLMASTERS' ASSOCIATION, IRELAND (*Secy.*, J. Thompson, M.A., The High School, Dublin), is similar to the I.A.H.M.

ASSOC. OF ASSISTANT MASTERS IN SECONDARY SCHOOLS, 29 Gordon Sq., W.C. 1. *Sec.*, G. D. Dunkerley, B.Sc.

THE BOYS' BRIGADE. (Incorporated.)

The senior boys' organisation; founded in 1883 by the late Sir William A. Smith. The object of the Brigade is attained by a combination of military and religious training. Every Company is connected with a Church or other Christian body. The total strength is 70,000 officers and boys. *Sec.*, R. S. Peacock, 34 Paternoster Row, E.C. 4.

CHURCH LADS' BRIGADE.

An organization especially valuable for helping a parish to keep the elder lads to their religious duties; was founded in 1891, and combines a military method with moral and religious instruction. It is estimated that 1,000,000 lads have had the advantage of the Brigade's training, and to-day there are 1,262 Companies throughout the Empire, with upwards of 60,000 lads.—*Headquarters*, Aldwych House, Catherine Street, W.C. 2. *Chaplain-General and Secretary*, Rev. Edgar Rogers, O.B.E., M.A.

BOY SCOUTS. (Incorporated).

A Movement initiated and organised by Lieut.-General Sir Robert Baden-Powell, G.C.V.O., K.C.B., Chief Scout, to develop good citizenship among boys by forming their character—training them in habits of observation, obedience and self-reliance; inculcating loyalty and thoughtfulness for others; teaching them services useful to the public and handicrafts useful to themselves, and promoting their physical development and hygiene.

The Movement has taken root in all parts of the British Empire, and nearly every other country has adopted it.—*Imperial Headquarters*, 25 Buckingham Palace Road, S.W. 1.

All the Universities in the British Isles (see pp. 265-273) admit women to membership and degrees.

Association of Head Mistresses.—Head mistresses of Public Secondary Schools with at least 50 pupils are eligible for membership. Members are marked § in the lists on pp. 315–320. A Conference is held annually in June. *President* (1923–25), Miss F. R. Gray, M.A., J.P., St. Paul's Girls' School, Brook Green, W. 1. *Secretary*, Miss R. Young, 29 Gordon Square, W.C. 1.

THE GIRL GUIDES.

A movement, incorporated by Charter in 1915, founded by Sir Robert Baden-Powell in 1910, and incorporated by Royal Charter, 1923. *President* (since 1920), H.R.H. the Princess Mary (Viscountess Lascelles); *Chief Guide*, Lady Baden-Powell. The aim of the movement is to develop a better practical knowledge of housekeeping, mothercraft and citizenship in the girl of to-day. The method of training is to give the girls pursuits which appeal to them, such as games, recreative exercise and badge tests which lead them on to learn for themselves many useful crafts, training them in habits of observance, obedience and self-reliance, promoting their physical development, and inculcating loyalty and thoughtfulness for others. The movement is non-military, non-political, non-class and interdenominational. Its desire is to co-operate with educational and other bodies working to the same end, and holding the same principles. The number of Girl Guides is approximately 325,000 in the British Empire, and the movement has spread to nearly every civilized country throughout the world, its total membership being approximately 500,000. *Imperial headquarters*, 25 Buckingham Palace Road, London, S.W. 1.
